Safety

TAKE NOTE! THIS SAFETY ALERT SYMBOL FOUND THROUGHOUT THIS MANUAL IS USED TO CALL YOUR ATTENTION TO INSTRUCTIONS INVOLVING YOUR PERSONAL SAFETY AND THE SAFETY OF OTHERS. FAILURE TO FOLLOW THESE INSTRUCTIONS CAN RESULT IN INJURY OR DEATH.

**THIS SYMBOL MEANS
ATTENTION!**

BECOME ALERT!

YOUR SAFETY IS INVOLVED!

Note the use of the signal words DANGER, WARNING and CAUTION with the safety messages. The appropriate signal word for each has been selected using the following guidelines:

DANGER: Indicates an imminently hazardous situation that, if not avoided, will result in death or serious injury. This signal word is to be limited to the most extreme situations typically for machine components which, for functional purposes, cannot be guarded.

WARNING: Indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury, and includes hazards that are exposed when guards are removed. It may also be used to alert against unsafe practices.

CAUTION: Indicates a potentially hazardous situation that, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

NOTICE is used to address safety practices not related to personal safety.

A Word to the Operator

SAFETY IS YOUR RESPONSIBILITY.

YOU are the key to safety.

It is YOUR responsibility to read and understand the safety messages in this manual.

This system may be used to apply many different kinds of agricultural liquid products. Read and follow all label information and instructions related to the handling, storage, and application of the product you are using.

All electrical harnessing should be checked regularly and should be routed and secured so it will not be pinched, cut, or stretched.

General Description

A

Introduction

You have purchased a SureFire fertilizer system for your equipment. This system will be controlled by your Ag Leader display and Ag Leader Liquid Product Control Module or ISO Liquid Module, which you will need to purchase from your Ag Leader dealer. The rate controller will adjust the speed of the SureFire electric pumps based on feedback from the flowmeter and vehicle speed. The system is capable of section control to minimize overlap areas with optional section valves. The system will also use the Ag Leader Aux Input Module and DirectCommand.

Basic Installation Steps

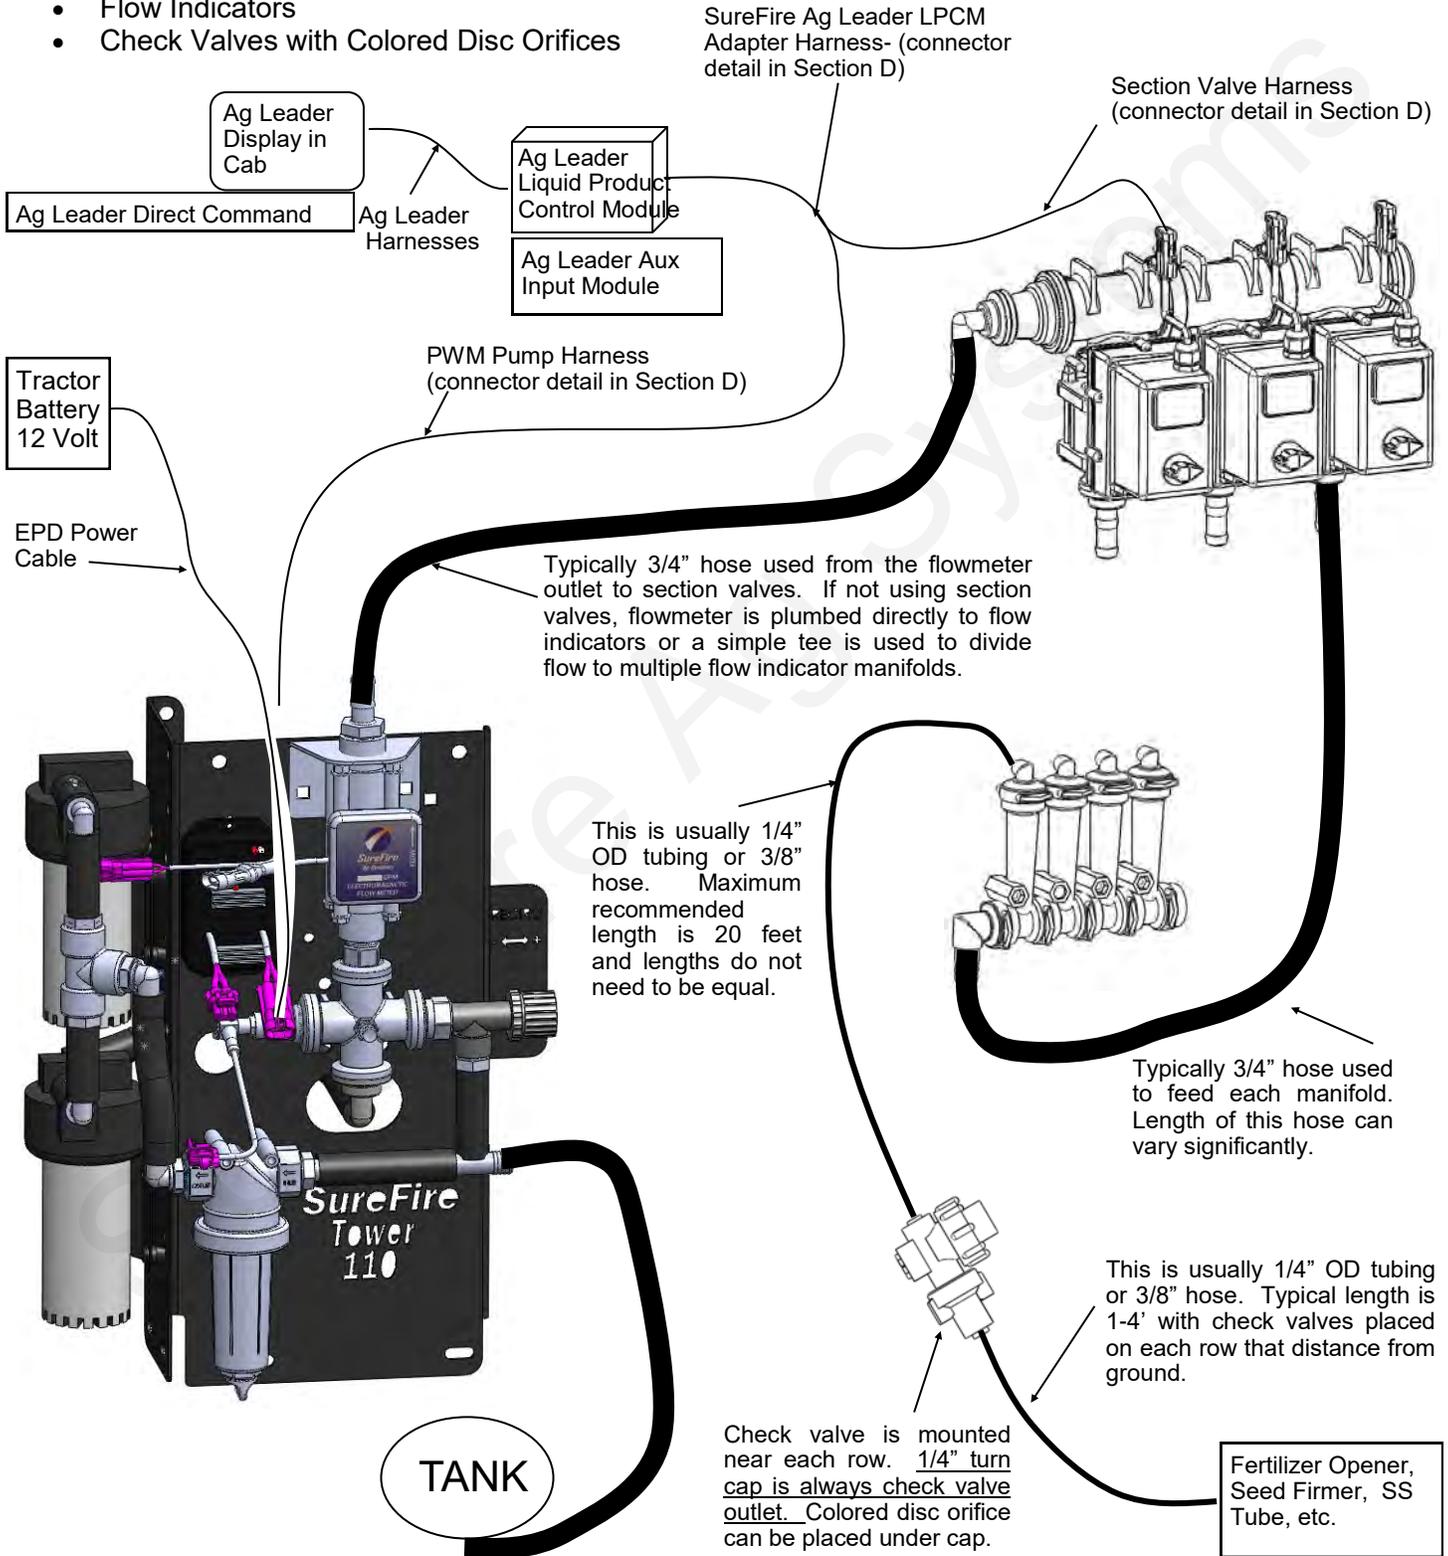

1. Install Ag Leader display, Liquid Product Control Module, Aux Input Module, and DirectCommand per Ag Leader instructions.
2. Open the packages and familiarize yourself with the components. Refer to manual sections B & D for component information.
3. Mount the Tower on your equipment.
4. Plumb the tank to the Tower inlet. See section E for details.
5. Install the plumbing kit including section valves, flow indicator columns / manifolds, check valves, plumbing to each row unit delivery point. See section B for information on these components.
6. Attach the flowmeter outlet to section valve or manifold inlet. Attach section valve outlets to flow indicator inlets.
7. Attach harnesses as shown in Section D. Be sure to plug in the 2-pin Deutsch power connector.
8. Set up Controller for SureFire fertilizer system as shown in Section F.
9. Fill system with water, conduct initial operation and tests per Section F.
10. Winterize system with RV Antifreeze if freezing temperatures are expected.

System Overview - Example 1

A Introduction

The following gives an example of a complete SureFire Fertilizer system with these components:

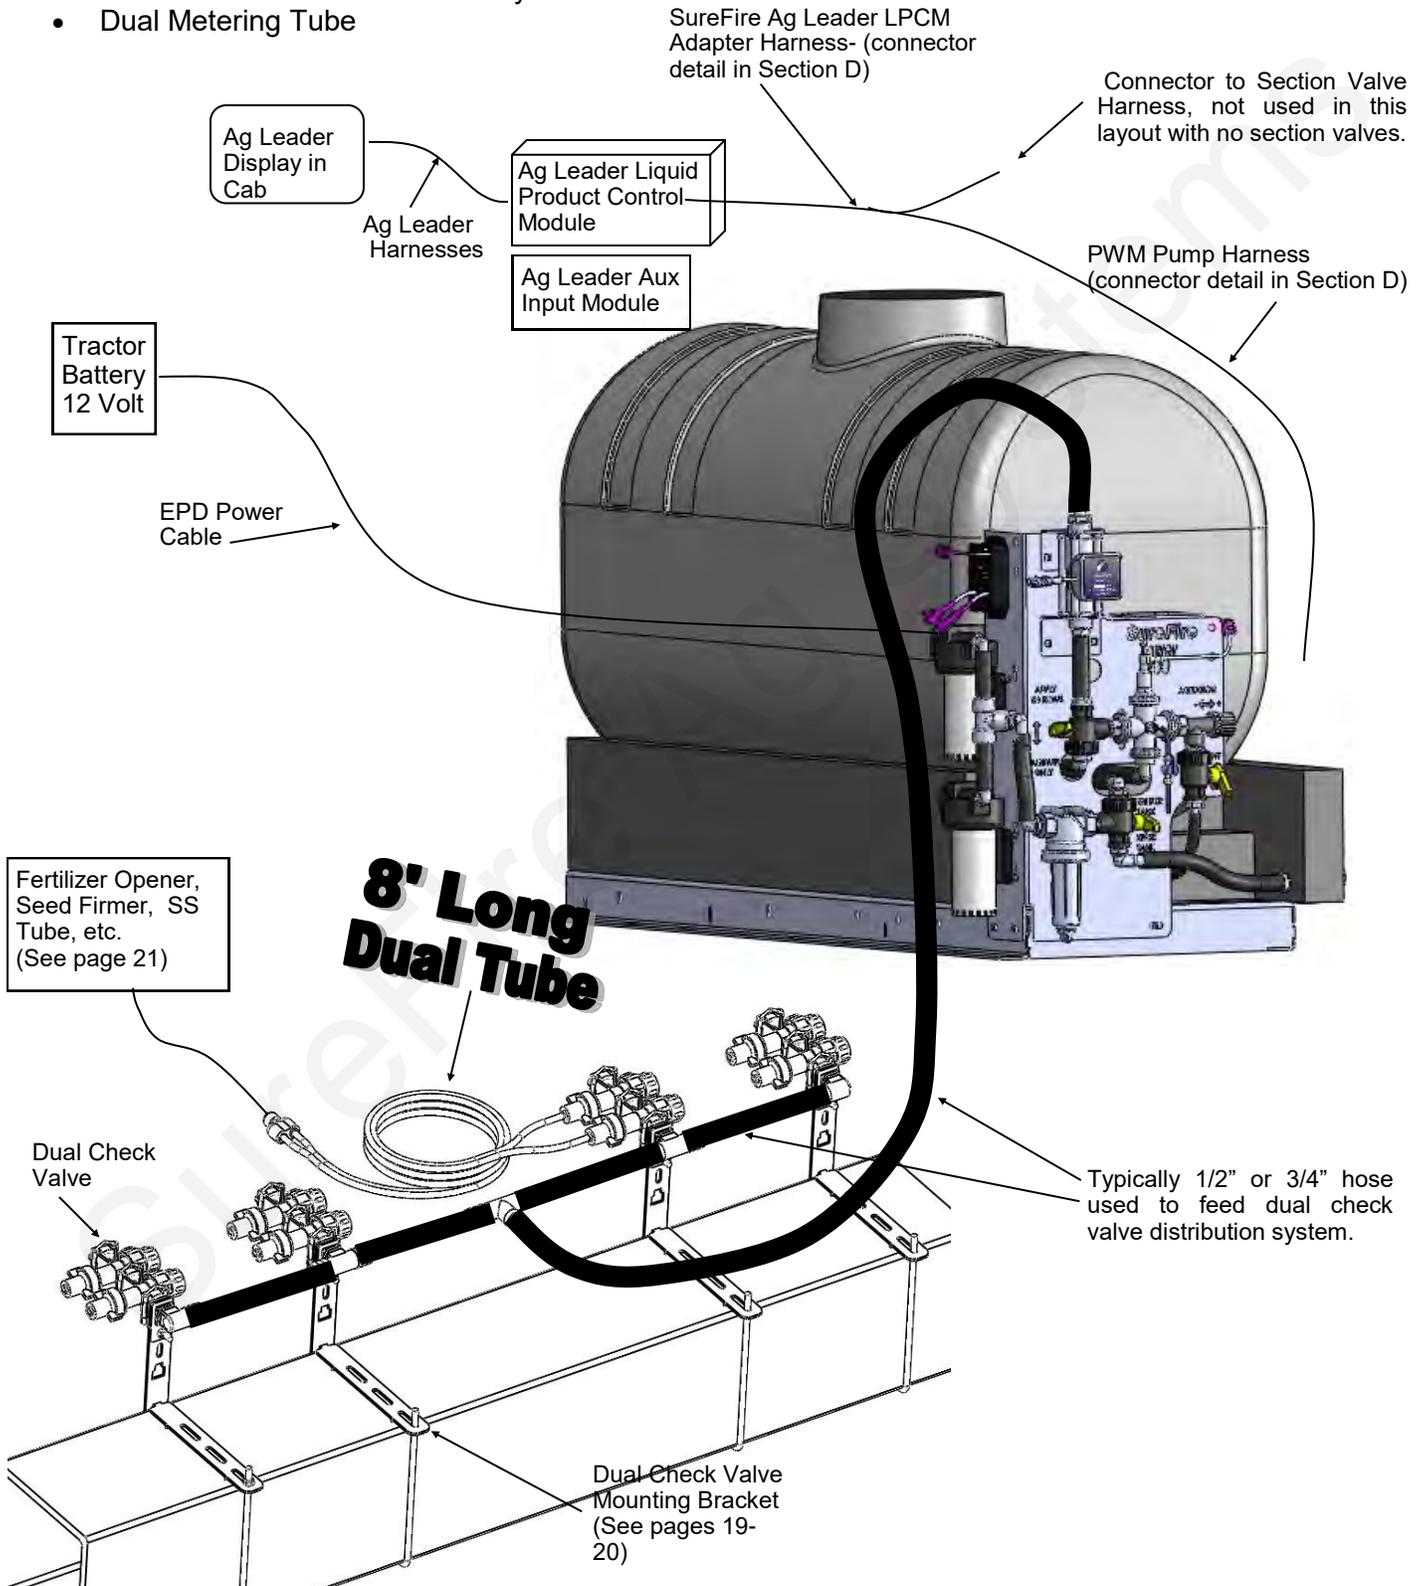

- Ag Leader Display
- Ag Leader Liquid Product Control Module, Aux Input Module, and DirectCommand
- Tower 110
- Section Valves
- Flow Indicators
- Check Valves with Colored Disc Orifices

System Overview - Example 2

The following gives an example of a complete SureFire Fertilizer system with these components:

- Ag Leader Display
- Ag Leader Liquid Product Control Module, Aux Input Module, and DirectCommand
- Accelerator with Tower 200
- Dual Check Valve Distribution System
- Dual Metering Tube

Electromagnetic Flowmeter Kits

0.13 - 2.6 GPM

Item Number 500-02-2040

0.3 - 5.0 GPM

Item Number 500-02-2050

0.08 - 1.6 GPM 204-01-46211CUF05 (FM only)

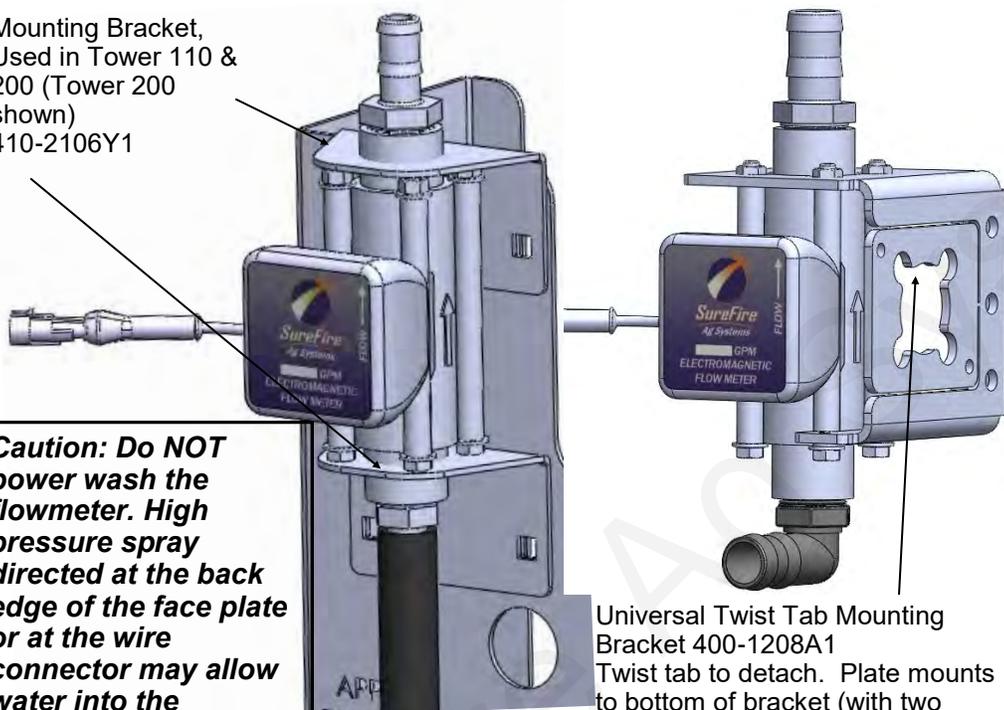

Kits include flowmeter, mounting bracket, hose barb fittings & hose clamps.

Before doing any arc welding on the implement, unplug the cable to the flowmeter, or damage to the flowmeter may result.

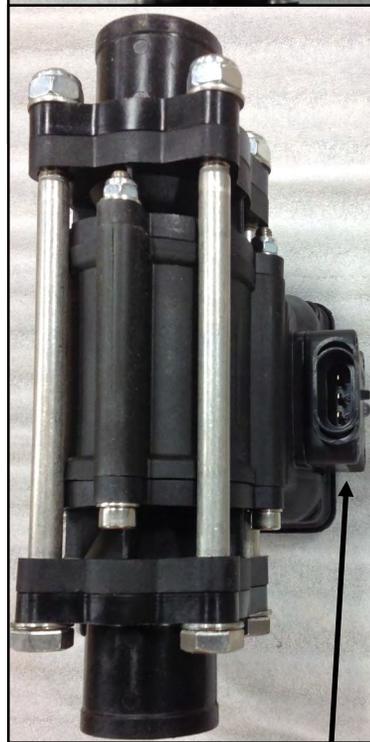

New Look in 2017—Black body with orange label. Same accurate, reliable electromagnetic technology. 3-pin Amp SuperSeal connector is sealed to flowmeter body for tighter, cleaner connection.

Mounting Bracket, Used in Tower 110 & 200 (Tower 200 shown) 410-2106Y1

Caution: Do NOT power wash the flowmeter. High pressure spray directed at the back edge of the face plate or at the wire connector may allow water into the flowmeter electronics.

Universal Twist Tab Mounting Bracket 400-1208A1
Twist tab to detach. Plate mounts to bottom of bracket (with two 1/4"x1" carriage bolts) to capture flowmeter.

Amp SuperSeal 3-pin connector Use adapter 201-17842 to connect to 3-pin MP harness

Electromagnetic flowmeters are superior to traditional turbine flowmeters in two basic ways. First, they have no moving parts. This translates into no wear items or potential for contaminants to jam a spinning turbine.

Second, electromagnetic flowmeters detect the flow by electrically measuring the velocity of the liquid, which makes them independent of viscosity or density of the fluid measured. They are extremely accurate using the standard calibration number. **SureFire still recommends you perform a catch test to verify the system is properly installed and configured.**

Flowmeter Model (orange label or blue label)	Pulses/Gal	FPT Size	Hose Barb In kit	Flowmeter Low Limit
0.13 - 2.6 GPM	3000	3/4"	3/4"	0.1
0.3 - 5.0 GPM	3000	3/4"	3/4"	0.2
0.08-1.6 GPM	22710	3/4"	3/4"	-

Serial number label on side also shows pulses per gallon.

*** Earlier model flowmeters (meters with white labels with black text) have different calibration numbers. See the documentation for those meters or look on serial number sticker to find calibration numbers.)**

105-100PLG (alternate
105-100PLG025 includes 1/4" pipe
thread for gauge)

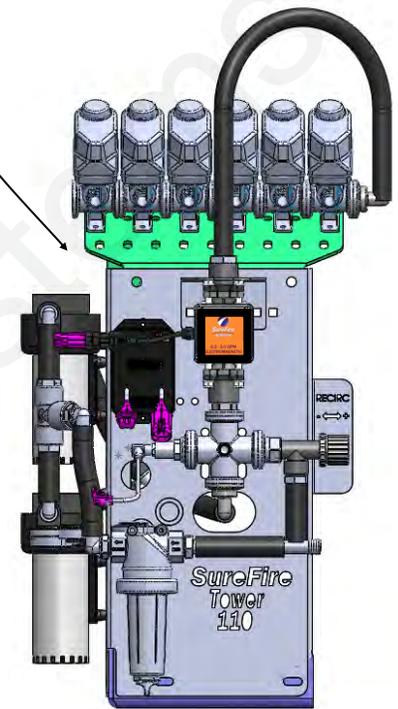

Note: Ensure back-side port
is capped prior to use

Additional Parts:

- 1" Gasket 105-100G-H
- 1" Clamp 105-FC100

**Tower 110 Section Valve
Bracket
Item Number 410-2110Y2**

The Tower 110 can have up to 6 section valves mounted directly to the top of it with this bracket.

If valve indicator stays GREEN all the time or if valve indicator is not in full ON or full OFF position, replace actuator. Pull gray pin to remove actuator from valve.

This is a 3-way valve. If product will not flow when valve is ON, either move the outlet hose to the other port, or remove actuator and rotate valve ball 180°, and replace actuator.

How it Works

Section valves can be assembled into groups with a common inlet to control flow to each section. Common assemblies use up to 5-6 valves, however, more can be used where practical. Many alternate fittings can be used to accommodate different hose sizes and configurations.

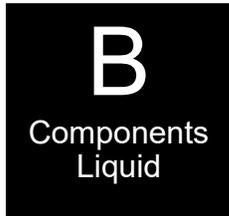

The valves have a 3-pin weather pack electrical connector. This has a power, ground, and switched signal wire. The power measured to ground should have 12 volts when the controller is on. The switched signal wire will have 12 volts to turn the valve on, and 0 volts to turn the valve off.

Wiring Connector:
Pin A—Red, 12 Volts +
Pin B—Black, Ground -
Pin C—White, Signal
12V=on ; 0V=off

Mounting Hardware:
2 Valve Bolt Kit 384-1100
Mounting Bracket 400-2493Y1

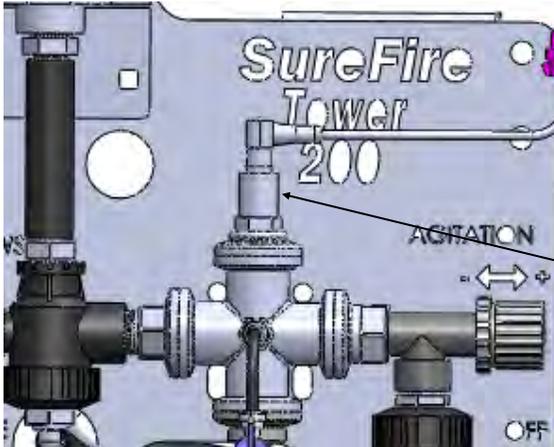

Pressure Sensor

The Tower 110 and 200 come equipped with a 100 psi (0 to 5 volt) pressure sensor to work with Ag Leader. This sensor is a 3 wire type sensor for compatibility with Ag Leader. The sensor has a 1/4" MPT fitting. The Ag Leader display has the ability to show pressure from 2 sensors on the display.

The Ag Leader display will show the system pressure on the in cab screen. The pressure reading is only for informational purposes and is NOT used in the flow control process. Flow control uses the flowmeter feedback only.

The pressure sensor is very helpful to optimize system performance and troubleshoot any issues.

The pressure transducer is factory calibrated and will display a very accurate pressure reading on the Ag Leader display. No manual gauge is required.

Pressure Sensor (3-wire type) with harness
521-05-050150

Ag Leader Pressure Calibration:
50 mv/psi

Pump Priming and Air Bleed Valve

An air bleed valve is included with each pump to aid in system priming. It is shipped in the pump accessories bag and must be installed during system installation.

Why use an air bleed valve:

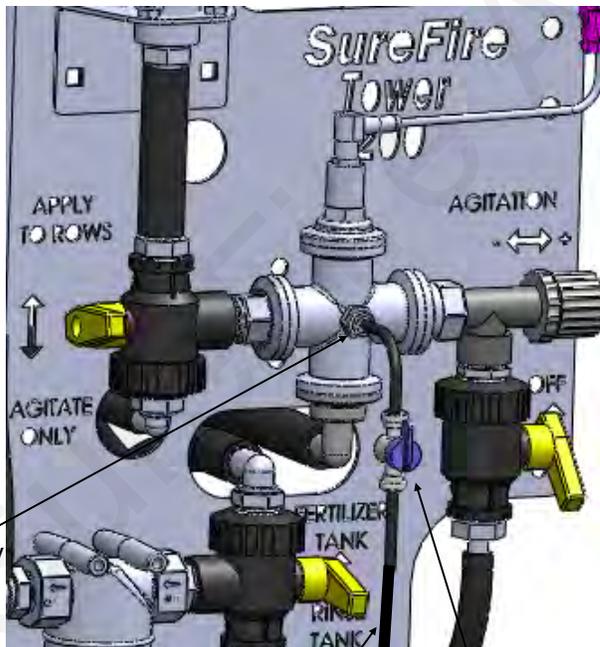

Most fertilizer systems are equipped with a 4 lb or 10 lb check valve on the end of each hose delivering fertilizer to the ground. These valves do not let air escape from the system, unless it is pressurized. 12-volt liquid pumps are not good air compressors. Therefore, the pump can struggle to prime due to air trapped on the outlet side of the pump.

The air bleed valve is a small 1/4" valve that when opened lets air escape from the pump outlet at zero pressure. Open until liquid comes out and then close the valve.

How to install the air bleed valve:

Remove the 1/4" plug from the quick connect fitting on the center cross on the Tower (see picture). Next, insert the 1/4" tubing in the quick connect fitting. Run the 1/4" tubing to an easily accessible spot on your equipment. Next, cut the tubing and push the 1/4" valve onto the tubing. Finally, run the tubing to a low location where any fertilizer that escapes will run on the ground.

Be sure the air bleed valve tube does not become plugged with dirt or it will not allow the air to bleed.

Shipped from factory with plug installed.

1/4" Tubing

1/4" air bleed valve

Product Distribution

To assure proper and even distribution to each row, the product being applied must be metered to each individual row. This metering is done by one of the 3 following methods which create back pressure so an equal amount of liquid is applied to each row.

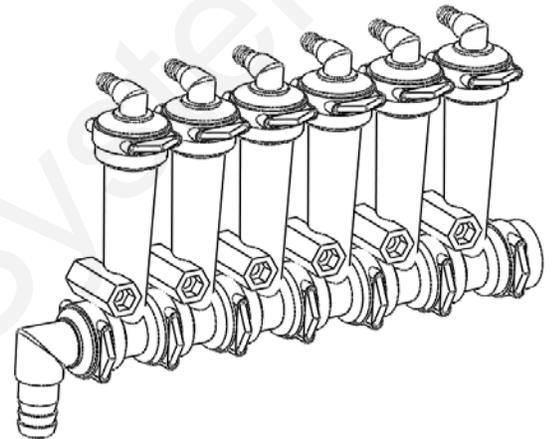

1. A metering orifice may be placed in the top cap of each floating ball flow indicator. (See photos on page 11—this is not used very often)
2. A metering orifice may be placed in the check valve cap in the line that leads to each row. (See photo on page 13)
3. A dual metering tube kit with dual check valves may be used. (See pages 18-21)

Floating Ball Flow Indicator & Manifold System

Flow indicators give a clear visual signal that a fertilizer system is working. These indicators use an o-ring and wire clip connection to snap together in any configuration necessary.

SureFire has simple tee brackets and U-bolts that will mount these to a variety of bar sizes.

Two main types of flow indicators are used. On 30" row spacing, the low flow column with 1/4" push to connect outlet is recommended for rates under 10 GPA. For rates over 10 GPA the full flow column with 3/8" hose barb outlet is preferred.

Parts List

Complete Columns

701-20460-950	Single Full Flow Column with 3/8" HB - 90 Degree Outlet
701-20460-940	Single Full Flow Column with 3/8" QC - 90 Degree Outlet
701-20460-960	Single Full Flow Column with 1/2" HB - 90 Degree Outlet
701-20460-935	Single Low Flow Column with 3/8" QC - 90 Degree Outlet
701-20460-920	Single Low Flow Column with 1/4" QC - 90 Degree Outlet

Fittings

701-20503-00	ORS x 3/4" HB - Straight
701-20511-00	ORS x 3/8" HB - 90 Degree
701-20512-00	ORS x 1/2" HB - 90 Degree
701-20513-00	ORS x 3/4" HB - 90 Degree
701-20516-00	ORS x 1/4" QC - 90 Degree
701-20517-00	ORS x 3/8" QC - 90 Degree
701-20518-00	ORS x 1/4" FPT - 90 Degree
701-20519-00	ORS x 1/4" FPT - Straight
701-20520-00	ORS Male x ORS Female - 90 degree
701-20521-00	Wilger End Cap
701-20523-00	ORS Male x ORS Female x 3/8" FPT - Isolator
701-20525-00	ORS Male x ORS Male x 1" FPT - Tee

Service Parts Only

701-20460-02	Wilger Flow Indicator Ball Retainer
701-20460-03	FKM O-Ring for indicator body & fittings
701-20460-04	Wilger Lock U-clip
701-20460-05	Flow Indicator Ball - 1/2" SS Ball
701-20460-06	Flow Indicator Ball - Maroon Glass
701-20460-07	Flow Indicator Ball - Red Celcon
701-20460-08	Flow Indicator Ball - Green Poly
701-20460-09	Flow Indicator Ball - Black Poly
701-20460-15	Viton O-Ring for column & fittings
701-40225-05	Viton O-Ring for Orifice

Brackets & U-Bolts

400-1037A1	3-6 Row Bracket
400-3155Y1	7-12 Row Bracket
400-2011A1	White Backer Plate for 3-6 Row Bracket
400-2010A1	White Backer Plate for 7-12 Row Bracket
400-1315A2	Flow Indicator Bracket, 6-8 in wide hitch mount

Floating Ball Flow Indicators- Full Flow Column (mostly 3/8" HB)

The full flow column is typically used with rates over 10 GPA on 30" rows. For rates less than 10 GPA SureFire recommends the low flow columns with 1/4" push to connect outlet fittings.

The full flow columns are most often assembled with 3/8" hose barb outlets. See the low flow info below for the difference between full and low flow columns.

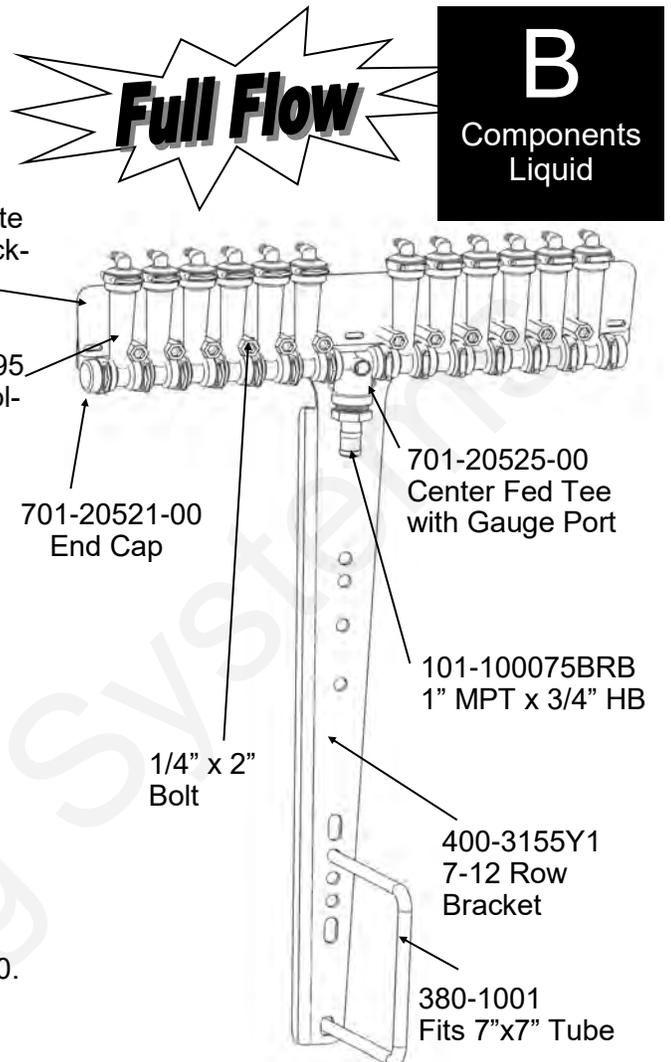

Full Flow Indicators w/ 3/8" Hose Barb Outlet

Column Flow (GPM): .05-2.70 GPM
Equivalent Application Rate
On 30" Rows at 6 MPH: 2-70 GPA

Ball Selection for 30" Rows

GPM	GPA	Ball
.05-.18	2-6 *	Green Plastic*
.09-.30	3-10 *	Red Plastic*
.31-.72	10-20	Maroon Glass
.40-2.1	13-70	Stainless Steel (1/2")

*SureFire recommends using the low flow column for these flow rates.
Plastic balls may float on heavier fertilizers, such as 10-34-0.

Low Flow Column (mostly 1/4" QC)

The low flow column has a smaller internal diameter. This means a heavier ball can be used to monitor a smaller flow.

SureFire uses the low flow columns with 1/4" push to connect outlet fittings. The flow capability of 1/4" tubing and the low flow column are a great pair for rates on 30" rows under 10 GPA.

Externally, the low flow column can only be identified by "Low Flow" molded into one side of the column. All the same fittings work with low flow and full flow columns.

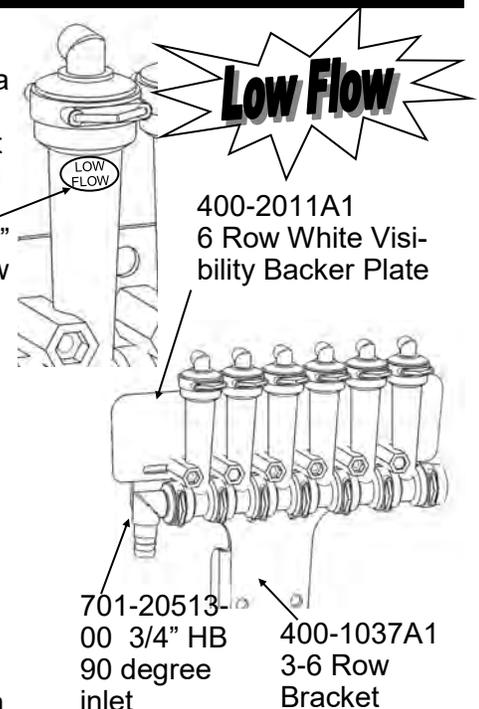

Low Flow Indicators w/ 1/4" Push to Connect Outlet

Column Flow (GPM): .03-.30 GPM
*** Low Flow Column with 3/8" hose barb .03 - .70 GPM
Equivalent Application Rate
On 30" Rows at 6 MPH (1/4" QC): 1-10 GPA

Ball Selection for 30" Rows

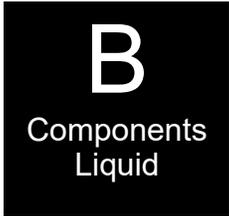

GPM	GPA	Ball
.03-.09	1-3	Green Plastic*
.05-.14	2-4	Red Plastic*
.10-.18	3-6	Maroon Glass
.15-.70	5-10	Stainless Steel (1/2")

*These balls may float on heavier fertilizers, such as 10-34-0. Use Maroon Glass in this case.

Floating Ball Flow Indicators– Metering Orifice Selection for 30” Rows

Tower Electric Pump Pressure Recommendations (with 4 lb check valves):

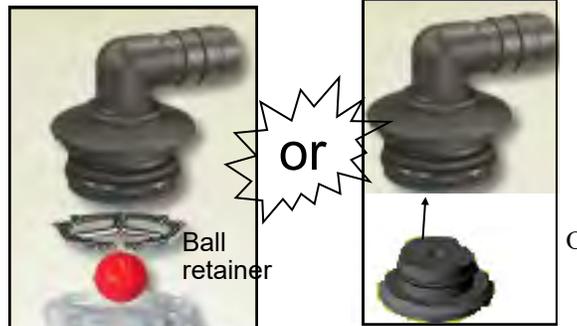

- Minimum 10 PSI
- Maximum 30 PSI (The pumps will operate up to 60 PSI, but the pump output decreases greatly at higher pressures. If pump will hit rate, high pressure is not a problem.)

PumpRight Pressure Recommendations (with 10 lb check valves):

- Minimum 20 PSI
- Maximum 80 PSI

Chart is for 28-0-0 Fertilizer @ 70°

- Heavier fertilizers (like 10-34-0) will have 5-15% less flow than chart indicates for a certain pressure
- Cold fertilizers will cause system pressure to increase at a given application rate.
- Tower Electric Pump Systems will have reduced flow and increased electrical current draw due to cold fertilizer increasing operating pressure. **Use the largest orifice possible for cold weather operation.**

If using a metering orifice in the flow indicator, the orifice replaces the ball retainer. If not using an orifice here, the ball retainer must be in place.

Remove top fitting of each column. Then push the metering orifice into bottom of each outlet fitting.

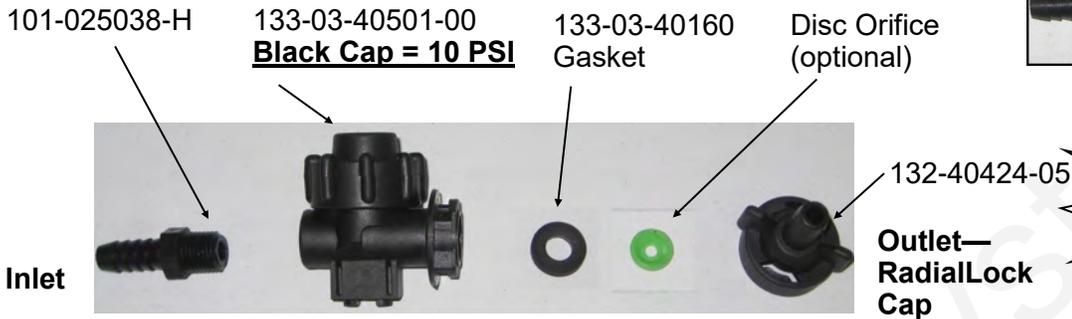

All application rates (gallons/acres) are estimates based on 0-28-0 (10.65 lbs/gallon) at 70 degrees F.

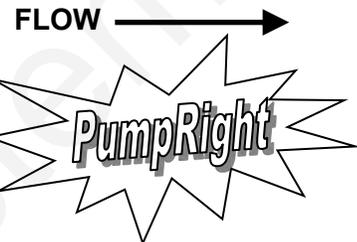

Check Valves

10 lb check valve with 3/8" hose barbs

The recommended check valve for most **PumpRight** installations is the 10 lb check with 3/8" hose barbs. This works with 3/8" rubber hose which SureFire recommends for most applications over 10 GPA on 30" rows. The recommended minimum system operating pressure for this check is 20 psi, to ensure all checks open fully.

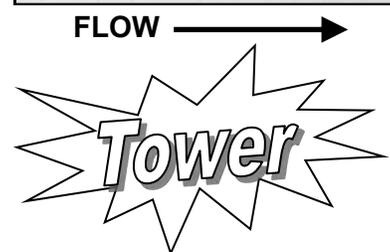

B
Components
Liquid

4 lb check valve with 1/4" quick connect fittings

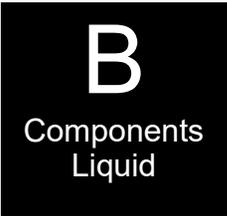

4 lb check valves are typically used with **electric pump systems**. SureFire recommends this valve for use with 1/4" tubing applying up to 10 GPA on 30" rows. The recommended minimum system operating pressure for this check is 10 psi, to ensure all checks open fully.

Special Purpose Check Valve Assemblies

Assembly Part Number	Description	Suggested Uses (30" rows)

All application rates (gallons/acres) are estimates based on 0-28-0 (10.65 lbs/gallon) at 70 degrees F.

SureFire Ag Systems

Dual Metering Tube Plumbing Kits with Dual Check Valve

(For more information on metering tube, see [this article](http://www.surefireag.com/cms/images/Metering-Tube-Maze_Reduced.pdf). (http://www.surefireag.com/cms/images/Metering-Tube-Maze_Reduced.pdf)

SureFire dual metering tube plumbing kits are a great way to plumb a planter to apply starter fertilizer. They'll also work on other implements when applying low rates or high rates of fertilizer.

These plumbing kits will contain everything you need to distribute fertilizer from the flowmeter outlet down to the ground application device of your choice (not included).

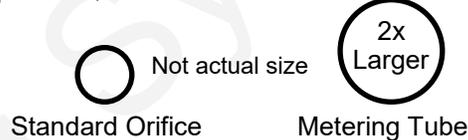

These instructions will show you where all the pieces go. It will provide guidance on how much metering tube to use. There are some optional fittings included in each plumbing kit. These instructions will show you where and why you'd want to use the optional pieces.

The dual check valve assembly is a key piece in the dual metering tube design. In addition to a check valve to stop fertilizer from draining when the system is shut off, **each check valve has an on/off valve on top of it. These on / off valves allow the operator to turn on only tube 1, only tube 2, or both tube 1 and 2. This provides for three different application ranges**, which is especially helpful when using Black Label Zn fertilizer (or any other liquid) which has a highly variable viscosity based on temperature changes.

Dual Advantage of Dual Metering Tube

Metering tube provides a larger passage-way diameter than a comparable orifice. For a 5 GPA rate on 30" rows, a size 0.046" orifice would be used. For the same rate a 0.110" meter tube that is 8' long would be used. This 8' tube with more than twice the diameter creates a fertilizer system resistant to plugging while providing excellent row to row distribution.

By using two metering tubes, the fertilizer system can handle Black Label ZN (or most other liquid solutions) and provide the proper system pressure as the fertilizer properties change due to temperature, mixtures and other factors.

Field Operation of Dual Metering Tube - Dual Check Valve System

The dual metering tube allows for three application rate ranges. Black Label ZN and other liquid fertilizers can have a widely variable viscosity range. Therefore, based on temperature, tank mixing and fertilizer batch, the best tube to use will change.

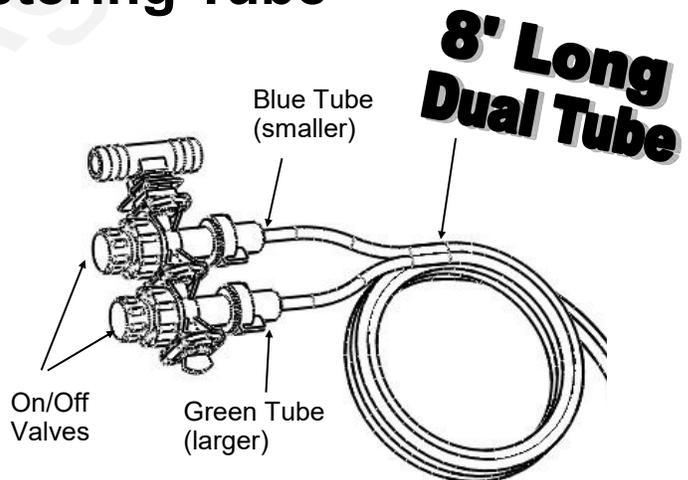

SureFire recommends you start with the Green (or larger) tube ON only. This is the middle application range and is a good starting point. Conduct a test using the test speed mode to determine your system pressure. Recommended pressure is between 8 - 30 PSI. If pressure is below 8 psi, some check valves may not open and row to row distribution will be uneven. If pressure is too high, pump output will decrease and you may not reach the target rate.

Start with green (or larger) tube ON, blue tube OFF:

• **Pressure below 10 PSI: Turn green tube OFF and blue tube ON.**

Pressure over 30 PSI: Turn BOTH tubes ON.

(Other color tubes are available for different application rates.)

	GPA on 30" rows (approx, will vary)
Blue Tube	1.5 - 3
Green Tube	3 - 6
Blue & Green Tube	6 - 10
Minimum Recommended flow for Blue Tube (8 ft)	4 - 5 oz/min

**** Ultra Low Rate Application –For rates from 2-5 oz/min/row use a 12 foot length of metering tube. To calculate oz/min/row: Oz/min/row = (GPA x MPH x spacing (inches)) ÷ 46.4**

Dual Check Valve Plumbing Diagram

4 Row Planter Shown, add rows as necessary

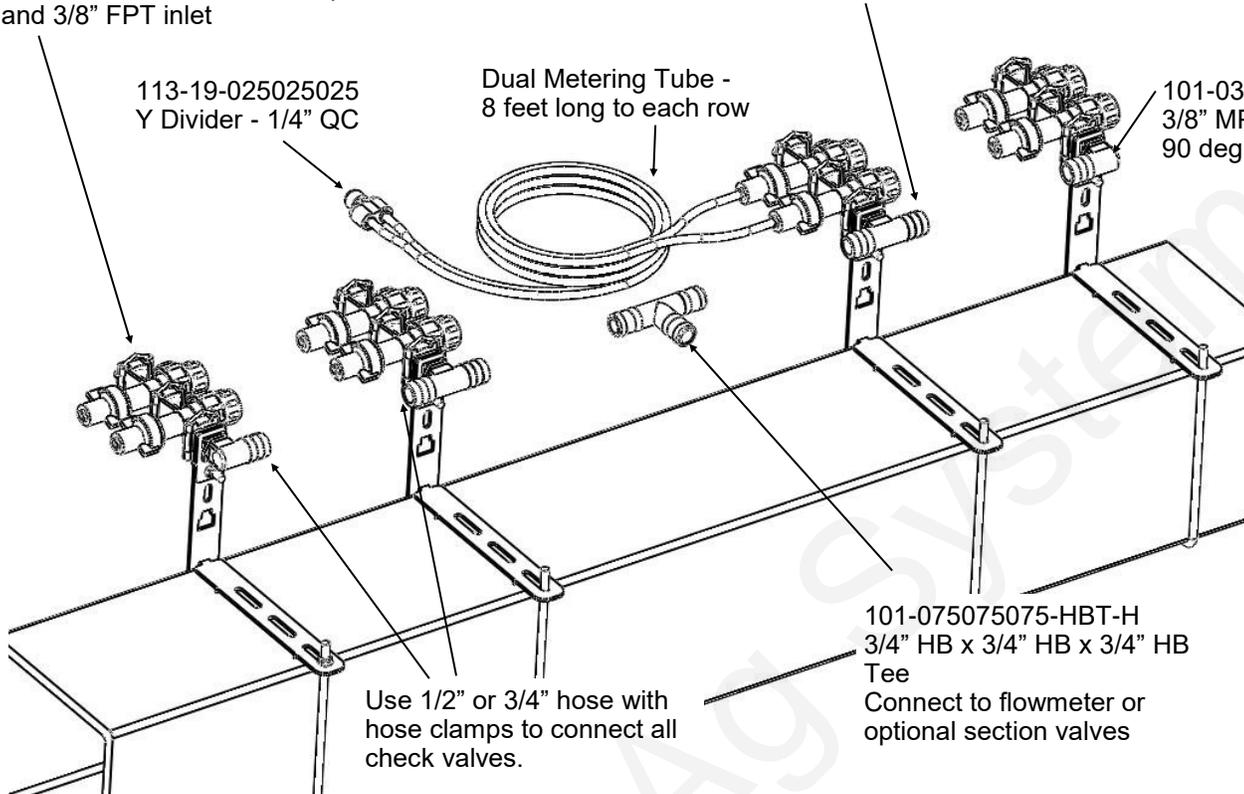

136-04-200400, Dual 4 PSI check valve with 1/4" QC caps and 3/8" FPT inlet

101-075075038-HBT-M-W 3/4" HB x 3/4" HB x 3/8" MPT Tee

113-19-025025025 Y Divider - 1/4" QC

Dual Metering Tube - 8 feet long to each row

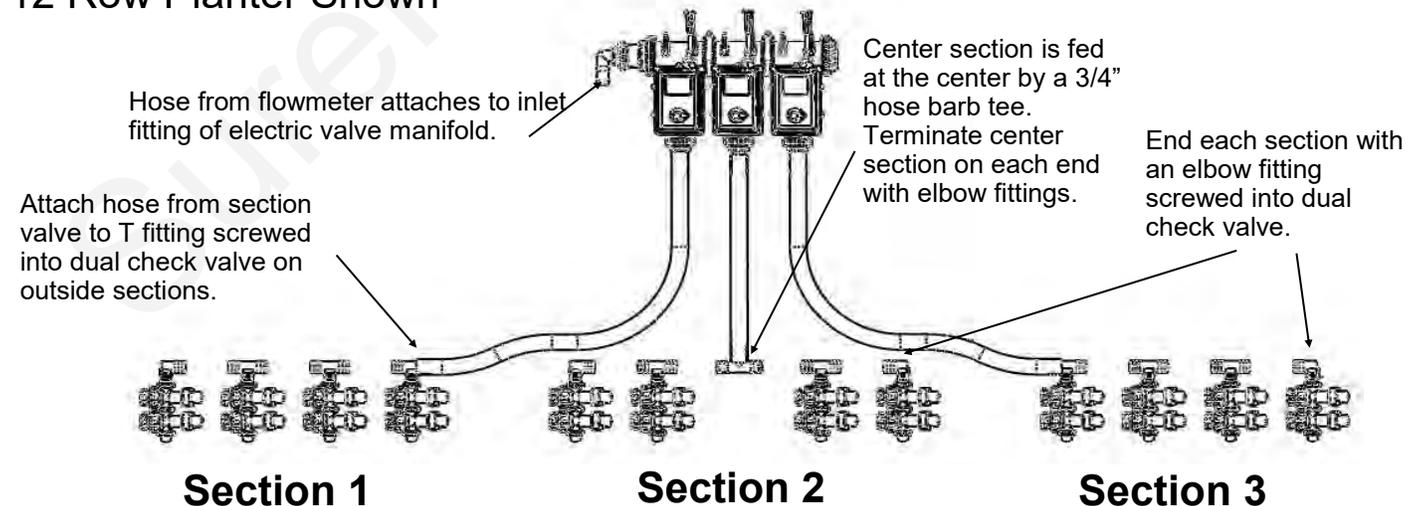

101-038075-90-W, 3/8" MPT x 3/4" HB - 90 degree

This is a general diagram showing the dual check valve assembly mounted on a planter toolbar. The check valve and bracket are very flexible in their mounting. The check valve can mount behind, directly over, or in front of the toolbar. The check valve can be put in the bracket facing up & down or sideways (shown). In addition the steel bracket could be rotated 90 degrees and clamp around the bar. The multiple slots in the bracket are used to mount to any tube 7x7 inches or smaller.

Sectional Plumbing Diagram with Dual Check Valves

12 Row Planter Shown

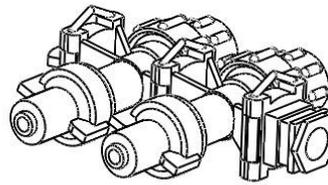

For a **2 section plumbing system**, omit the center section and plumb similar to the outside 2 sections.

Dual Check Valve Assembly Steps

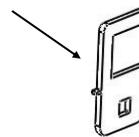

B
Components
Liquid

Follow these steps to mount each check valve to the steel bracket.

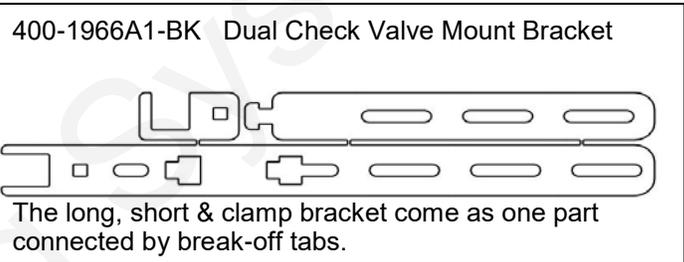

1. Screw the 3/8" MPT x 3/4" HB tee or elbow into the check valve using blue thread sealer. Orient the hose barb to run the 3/4" hose down the planter toolbar.
2. Insert the check valve into the "C" notch in the end of the bracket, according to how you want the check valve to be mounted on your planter. Orient the wire clips up or to the side for easiest access.
3. Slide the small "C" clamp bracket around the check valve to lock it in place.
4. Install the 1/4" carriage bolt and flange nut to secure the "C" clamp plate around the check valve.
5. Now, mount the check valve on the bar. Hold the check valve and long bracket assembly on the toolbar. Slide the tab on the front of the short bracket into the upper or lower notch on the long bracket.
6. Slide the L bolt into the appropriate slots on the brackets for your tube size. Tighten the 1/4" flange nuts to hold the bracket in place.

Clamp Bracket

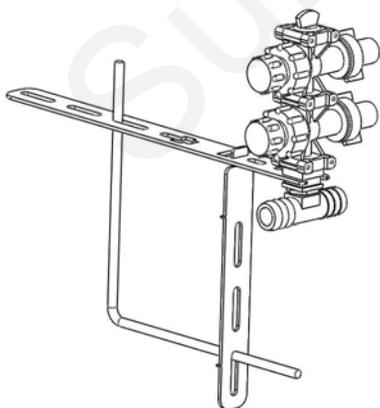

Elbow at end of section, Tee in mid-locations.

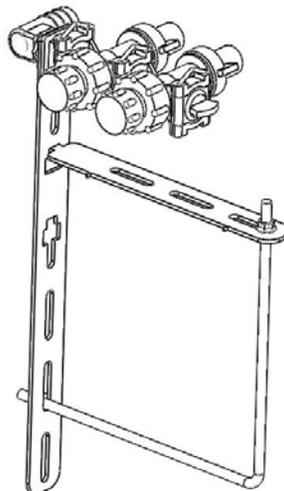

Check Valve Mounting Options

The dual check valve mounting bracket is very flexible to fit many different planter configurations. Three options are shown here to illustrate some of the possibilities.

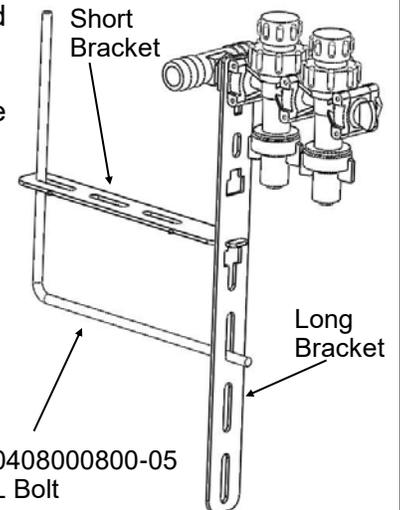

Example 1. Use the long bracket on the top of a bar. The check valve is mounted vertically. The liquid supply hose is run directly on the front side of the bar. The U-bolt is placed in slots to clamp on a 4x6 inch tube.

Example 2. Use the long bracket on the rear of a bar. The check valve is mounted over the top of the bar. The supply line would run above and behind the bar. The short bracket is placed in the notch to mount the check valve closer to the bar.

Example 3. Use the long bracket on the front of a 3x7 bar (vacuum tube on some planters). Mount the check valve hanging forward of the bar. The supply line will run directly over the bar. The excess bolt and bracket length can be cut off.

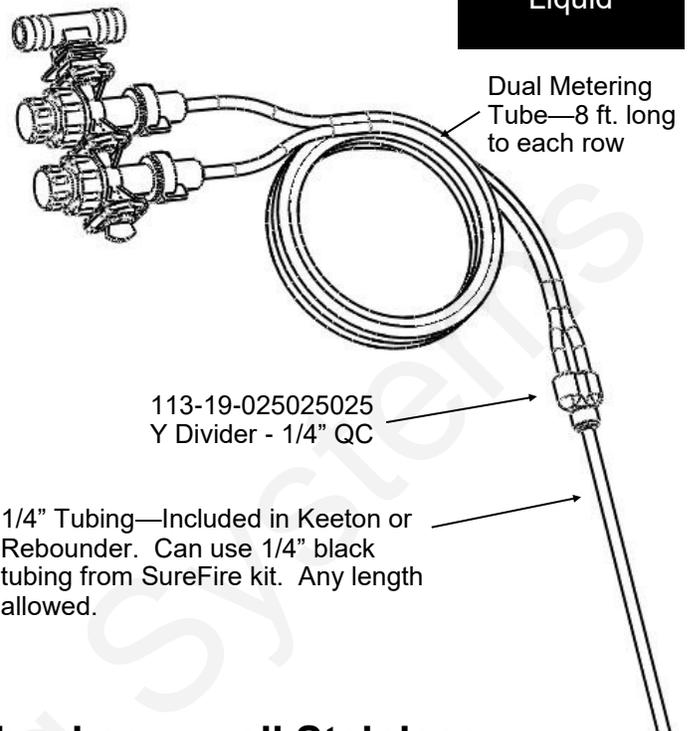

Connection to Keeton Seed Firmer, Rebounder Seed Covers or through thin wall stainless steel tubes

B
Components
Liquid

1. Mount the Keeton Seed Firmer or Rebounder Seed Cover.
2. Route the tube included in the above kit as instructed.
3. Attach the 1/4" tube to the 1/4" QC Y divider fitting.
4. Zip all tubing to the planter and row unit in as many locations as possible.

For thin wall stainless steel tubes, you can push the 1/4" black tubing all the way through the stainless steel tube so fertilizer will run directly from the tubing onto the ground.

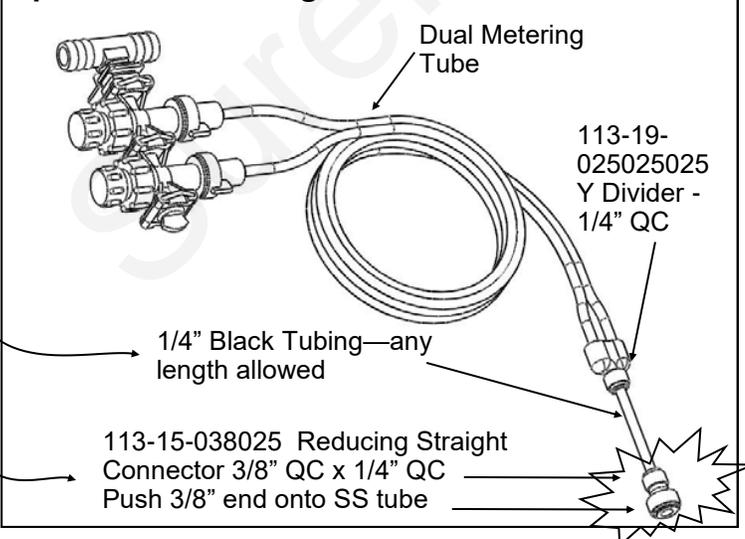

Connection to Totally Tubular or other heavy wall Stainless Steel Tube Ground Application Devices

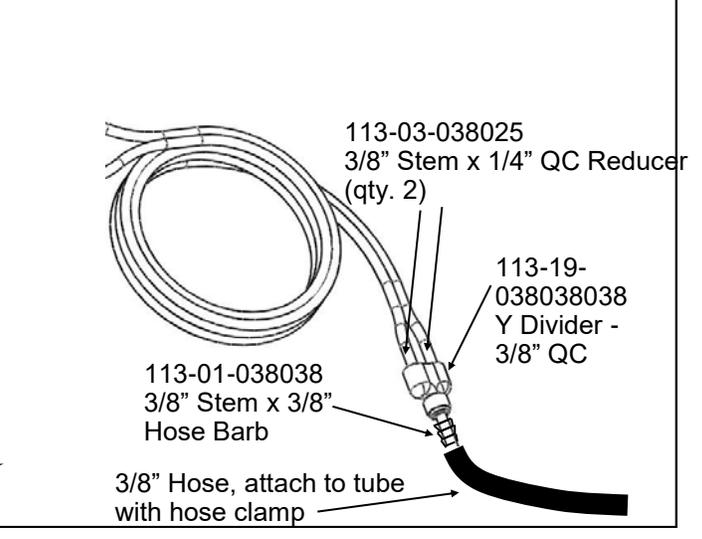

When using a 3/8" OD stainless steel tube to apply fertilizer to the ground, there are two options for the delivery tube plumbing. If the tube ID is less than 1/4" (tubing will not fit inside tube) this attachment method must be used. The description following is for Option 1. See bottom right picture for Option 2.

1. Use the 1/4" x 3/8" QC fitting shown. Push the 3/8" end onto the stainless steel tube. (Hint: if the fitting slips off the stainless steel tube, use sandpaper or a file to roughen the end of the tube slightly)
2. Use a short piece of 1/4" black tubing to connect the Y fitting to the reducer fitting on the stainless steel tube.
3. Zip all tubing to the planter and row unit in as many locations as possible.

Option 1: QC Fitting attaches to SS Tube

Option 2: 3/8" Hose attaches to SS Tube

Ag Leader Liquid Product Control Module

D

Wiring & Elec.

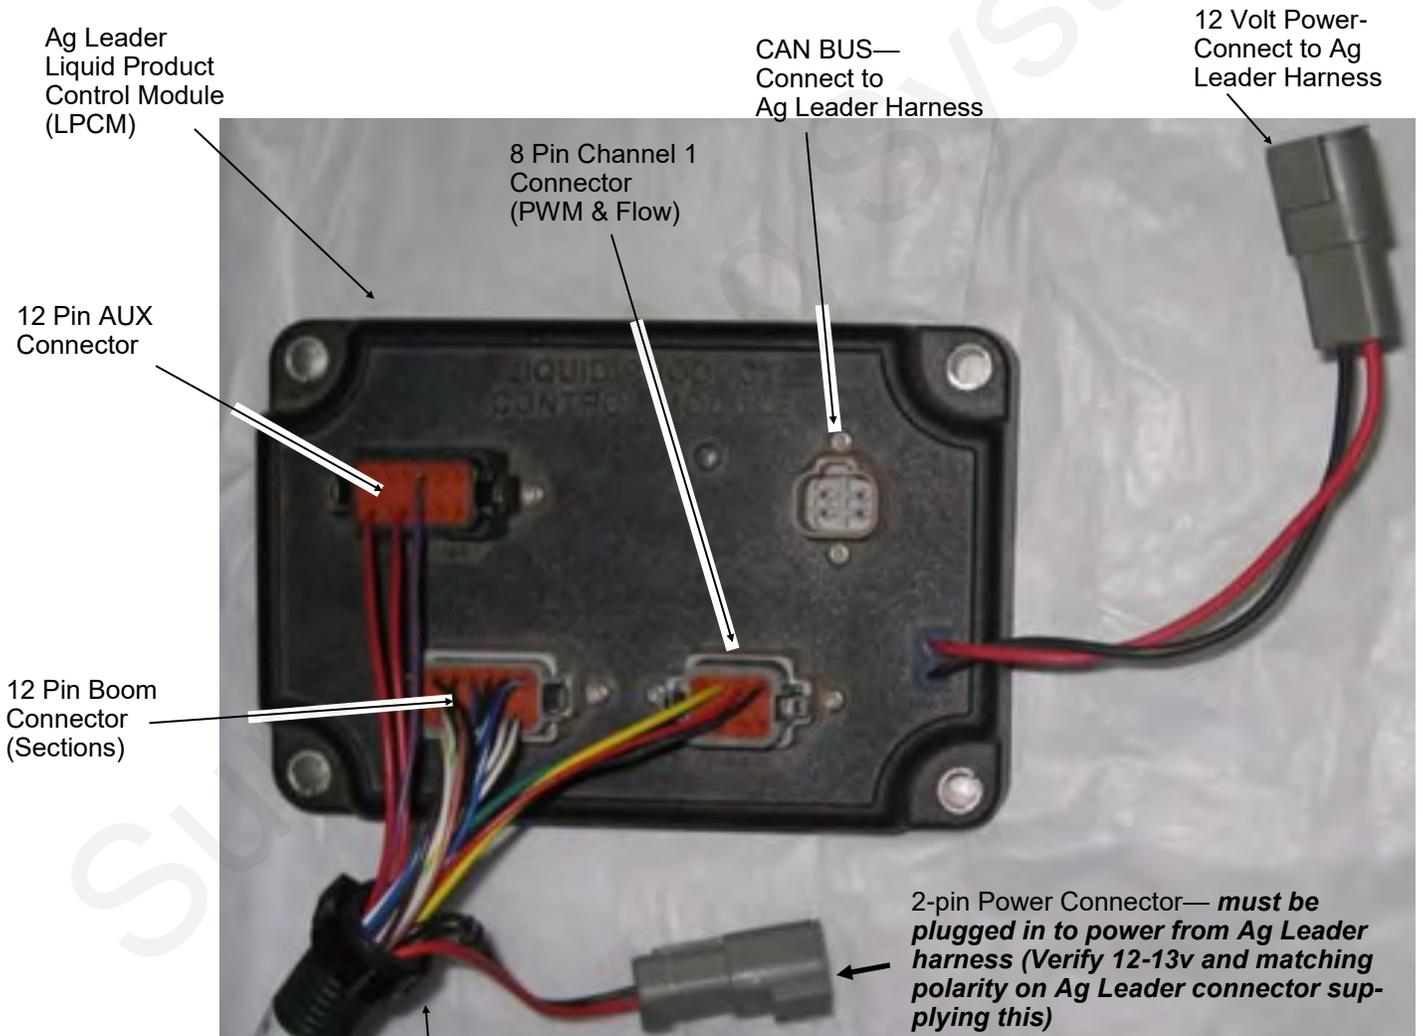

The Liquid Product Control Module is the legacy Ag Leader control module. It is still a very good control module.

Ag Leader also has an ISO Liquid Control module. The following pages show how to connect to both of these.

SureFire Fertilizer Systems begin at the Ag Leader Liquid Product Control Module. The picture below shows this control module. You will need to purchase this module from your Ag Leader dealer.

The rate controller has four harness connections. The function of each connection is labeled in the picture below and on the next page. The following pages show system diagrams for single section, 2-6 section and 7-12 (maximum of 10 sections of LPCM) section configurations. Detailed harness drawings follow for information and troubleshooting.

Instructions for setting up the Ag Leader in cab display are in Section F. Detailed screen shots of the display are included showing exactly what settings are required and recommended for SureFire Fertilizer Systems.

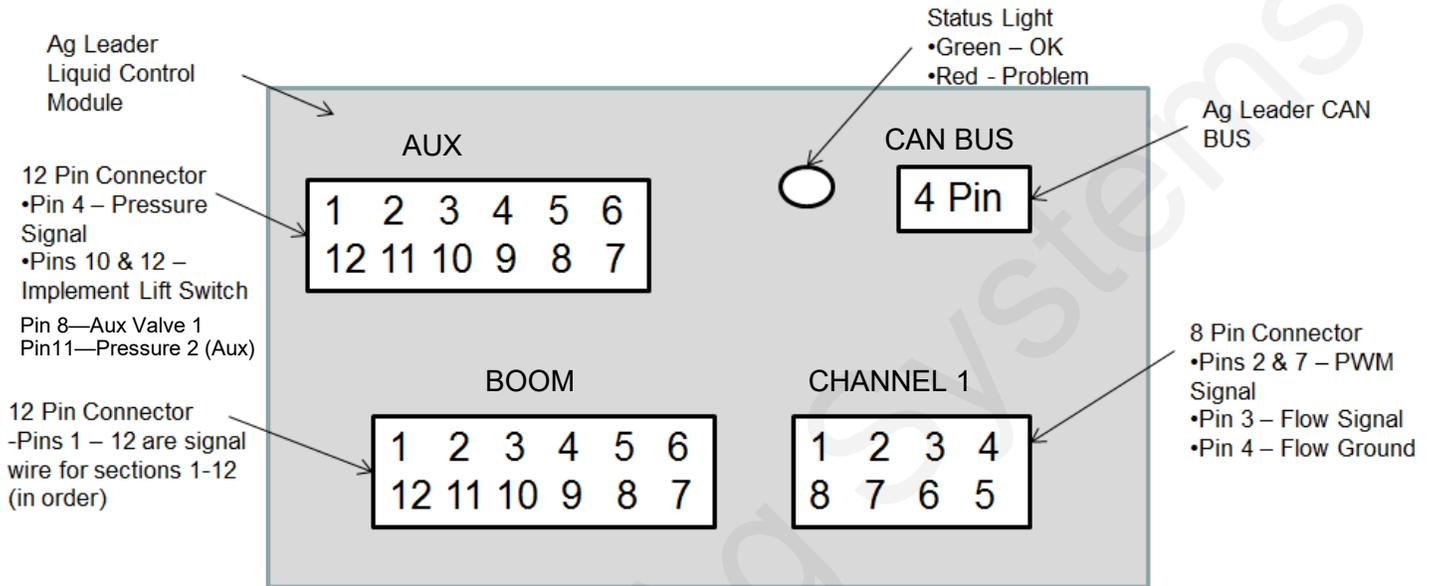

SureFire adapter for Ag Leader LPCM to pump and sections.
SureFire PN **201-215468Y*** or **213-01-3768Y***.

Implement Lift Switch Jumper (included) MUST be installed if no implement lift switch installed

Ag Leader Liquid Product Control Module

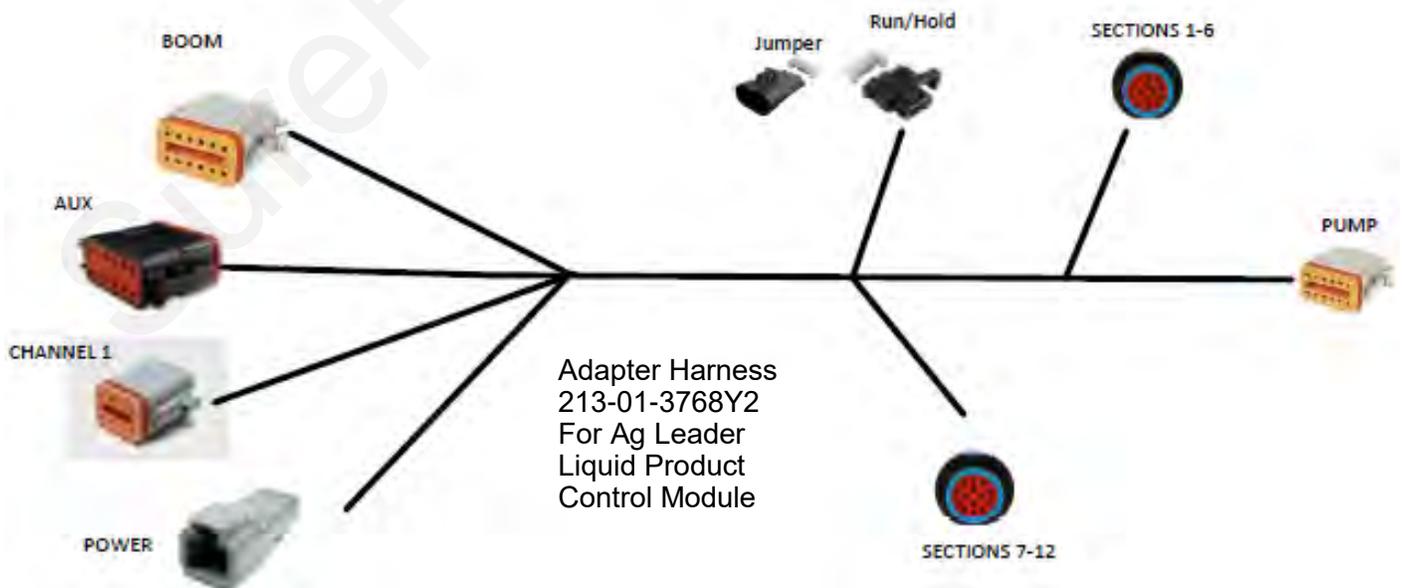

This chart shows you the output functions by pin location on the Ag Leader Liquid Product Control Module. Use this information to verify if the Ag Leader system is providing the correct output. If the module is not providing the correct output, contact your Ag Leader dealer to repair the problem. Also review any applicable settings on the display to verify the system is properly set up.

Common Troubleshooting:

PWM Signal to Pump: Pin 2 to 7 should have 0-12 volts to turn pump on. Use manual mode to increase signal. Should get up to 12 volts after holding increase button.

Flow meter Tap Test: Pins 4 and 3 are Flow Ground and Signal. If no flow is registering on the display, you can tap between these two pins with a short wire. This produces a pulse. The display should indicate a flow when this is done rapidly.

Ag Leader Gen 2 to Gen 1 Liquid Adapter

If the ISO Liquid Module is replacing an Ag Leader Liquid Product Control Module, start with the Gen 2 to Gen 1 Adapter and then use the same harnessing that was used before.

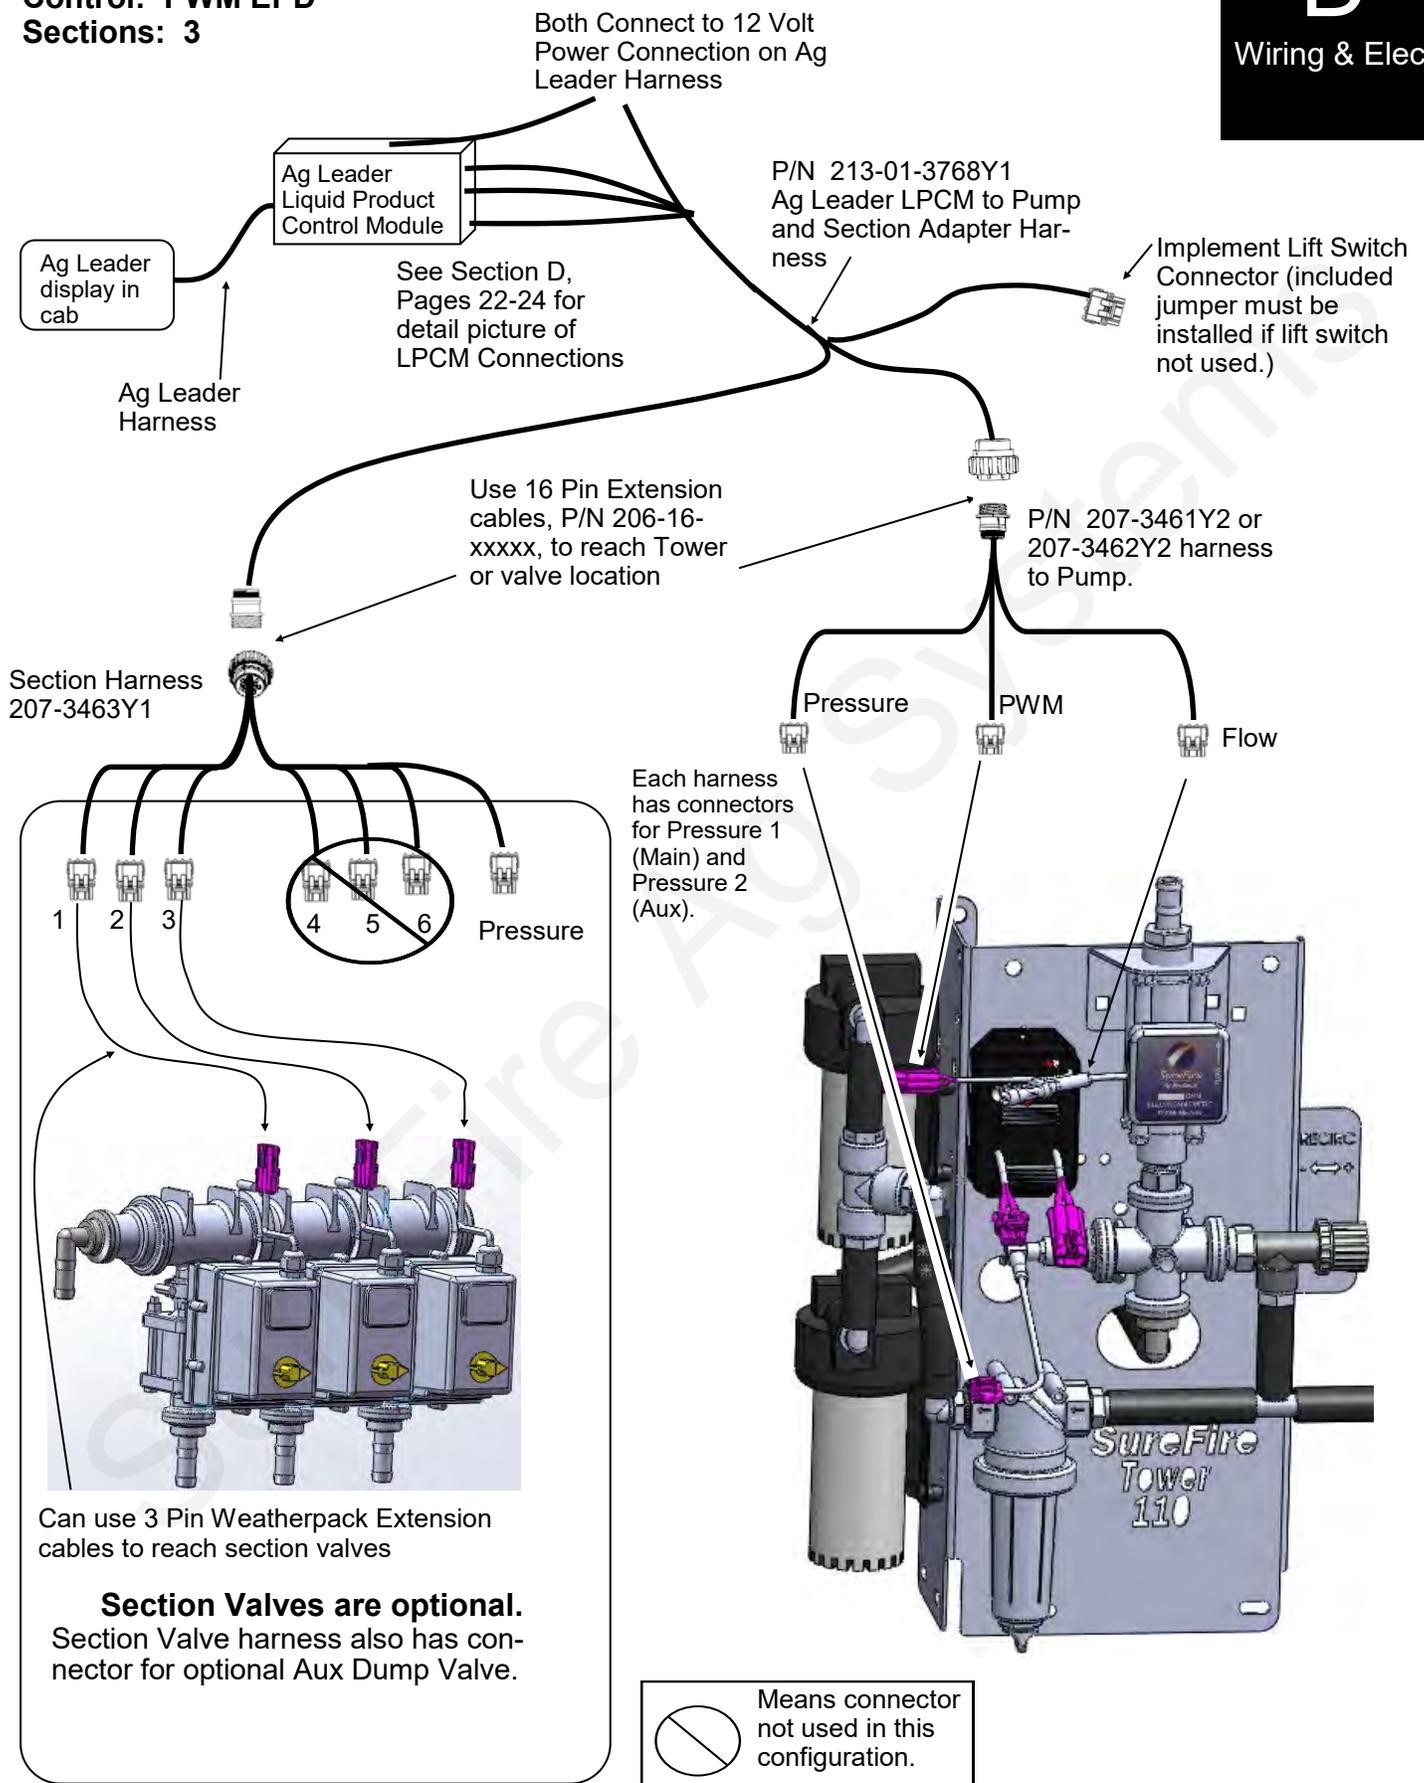

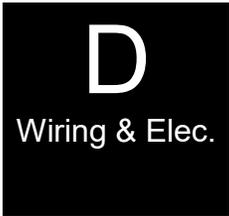

This adapter can also be used on a new setup if you will be using the Gen 1 harnessing from SureFire.

The adapter is not necessary if using SureFire 213-01-3620Y* adapter harness.

Tower & Ag Leader Control Layout

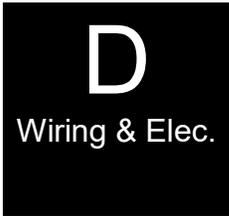

Control: PWM EPD

Sections: 3

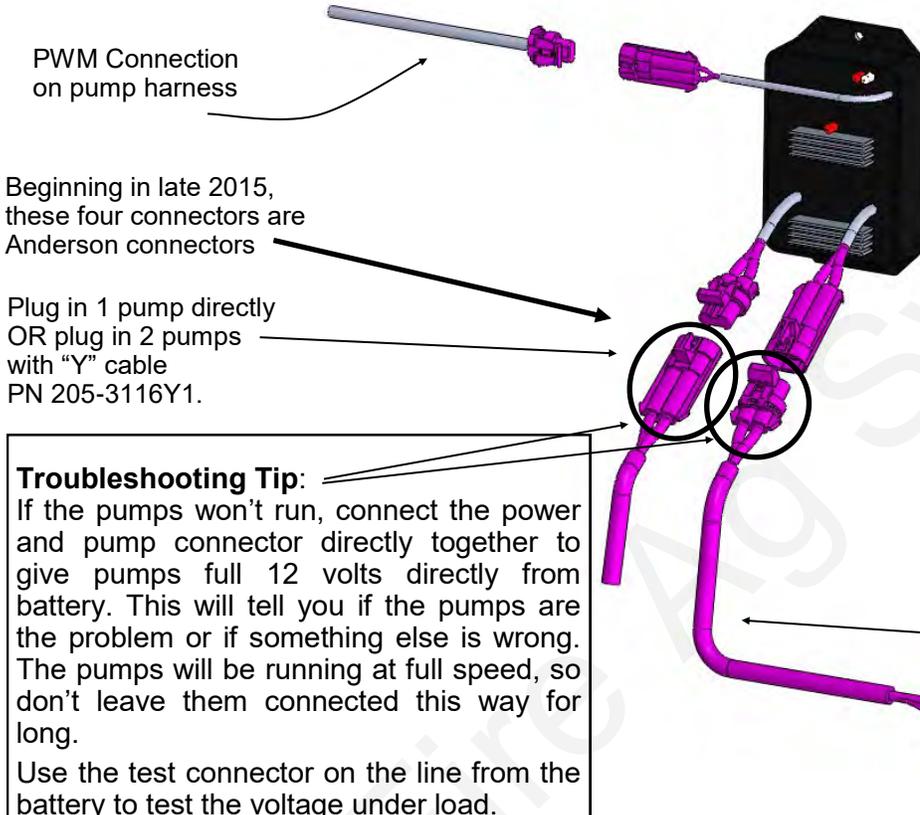

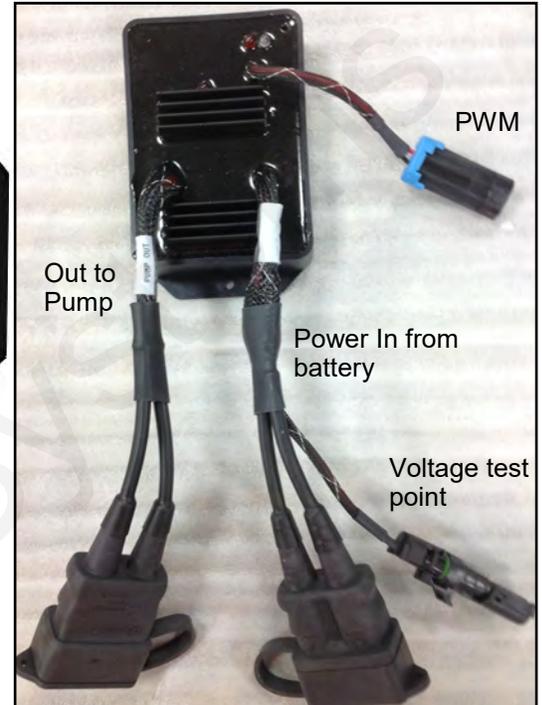

40 Amp PWM EPD

(Pulse Width Modulated Electric Pump Driver)
 Item Number: 205-19024 with Anderson connectors
 (replaces 205-18385 with 480 MP connectors)

The Electric Pump Driver powers 1 or 2 electric pumps by providing a pulse width modulated signal to control pump speed. It needs to have a power connection and wiring capable of carrying up to 40 amps of current. **It must be connected directly to the tractor battery.** SureFire recommends 8 gauge wire (or heavier) if extending harnesses in the field.

205-19024

Troubleshooting Tip:

If the pumps won't run, connect the power and pump connector directly together to give pumps full 12 volts directly from battery. This will tell you if the pumps are the problem or if something else is wrong. The pumps will be running at full speed, so don't leave them connected this way for long.

Use the test connector on the line from the battery to test the voltage under load.

The most common issue with the EPD will be a low voltage condition delivered to the EPD from the battery. Voltage drop occurs anytime current is moved through a wire. A low-voltage (12 v) system with long runs (60-80 feet) may have unacceptable voltage drops if any part of the system is weak or the load is high. This could be bad (corroded, weak, loose or burnt) connectors (at the battery, at the hitch, and at the EPD), too small of wire used (smaller wire equals more voltage drop), low source voltage, and heavy load. Any or all of these may contribute to a low voltage condition under load that may shut down the processor in the EPD module. This will be indicated by 4 quick flashes of the red light, followed by a short pause. Unplug the power-in connector to reset the EPD.

Use EPD **Power Harness Extensions** as needed (These have Anderson Connectors)

Part Number	Description	Wire Size
206-02-3120Y1	1' Extension	10 gauge
206-02-3121Y1	5' Extension	10 gauge
206-02-3122Y1	10' Extension	8 gauge
206-02-3123Y1	20' Extension	8 gauge
206-02-3124Y1	30' Extension	30' and longer—6 AWG
206-02-3125Y1	40' Extension	
206-02-3126Y1	50' Extension	
206-02-3127Y1	60' Extension	
206-02-3128Y1	2' Anderson Ext w/ Power Switch-8 AWG	

SureFire recommends a single long extension harness as multiple connectors will reduce voltage, increase current and hurt performance of your electric pump system.

Ag Leader Harness Wiring Diagrams

Your Ag Leader system may have one of the following sets of harnesses. The first set is being introduced for the 2018 season. The second set is the legacy set that has been used for several years.

New Ag Leader harnesses for the 2018 season for Liquid Product Control Module:

Adapter Harness

213-01-3768Y2 Ag Leader LPCM Adapter harness with 12-pin Product and 14-pin Section connectors

Pump Harness

207-3461Y2 12-pin Final Cable for Tower with 1 or 2 Section Valves (PWM, Flow, Pressure, Sections 1 and 2)

Or
207-3462Y2 12-pin Final Cable for SureFire Liquid System (PWM, Flow, Pressure)

Section Harness (if needed)

207-3463Y1 14-pin 6-section Final Cable

Ag Leader Legacy Harnesses for Liquid Product Control Module

Adapter Harness

201-215468Y4 Ag Leader Liquid Module to twin 16-pin AMP connectors

Pump Harness

207-215223Y2 PWM Pump Cable

Section Harness

207-215466Y2 16-pin 6-Section Harness

Harnesses for Ag Leader ISO Liquid Rate Control Module

Adapter Harness

213-01-3620Y1 Ag Leader Liquid ISO Module Adapter Harness with 6 sections

Pump Harness

207-3461Y2 12-pin Final Cable for Tower with 1 or 2 Section Valves (PWM, Flow, Pressure, Sections 1 and 2)

Or
207-3462Y2 12-pin Final Cable for SureFire Liquid System (PWM, Flow, Pressure)

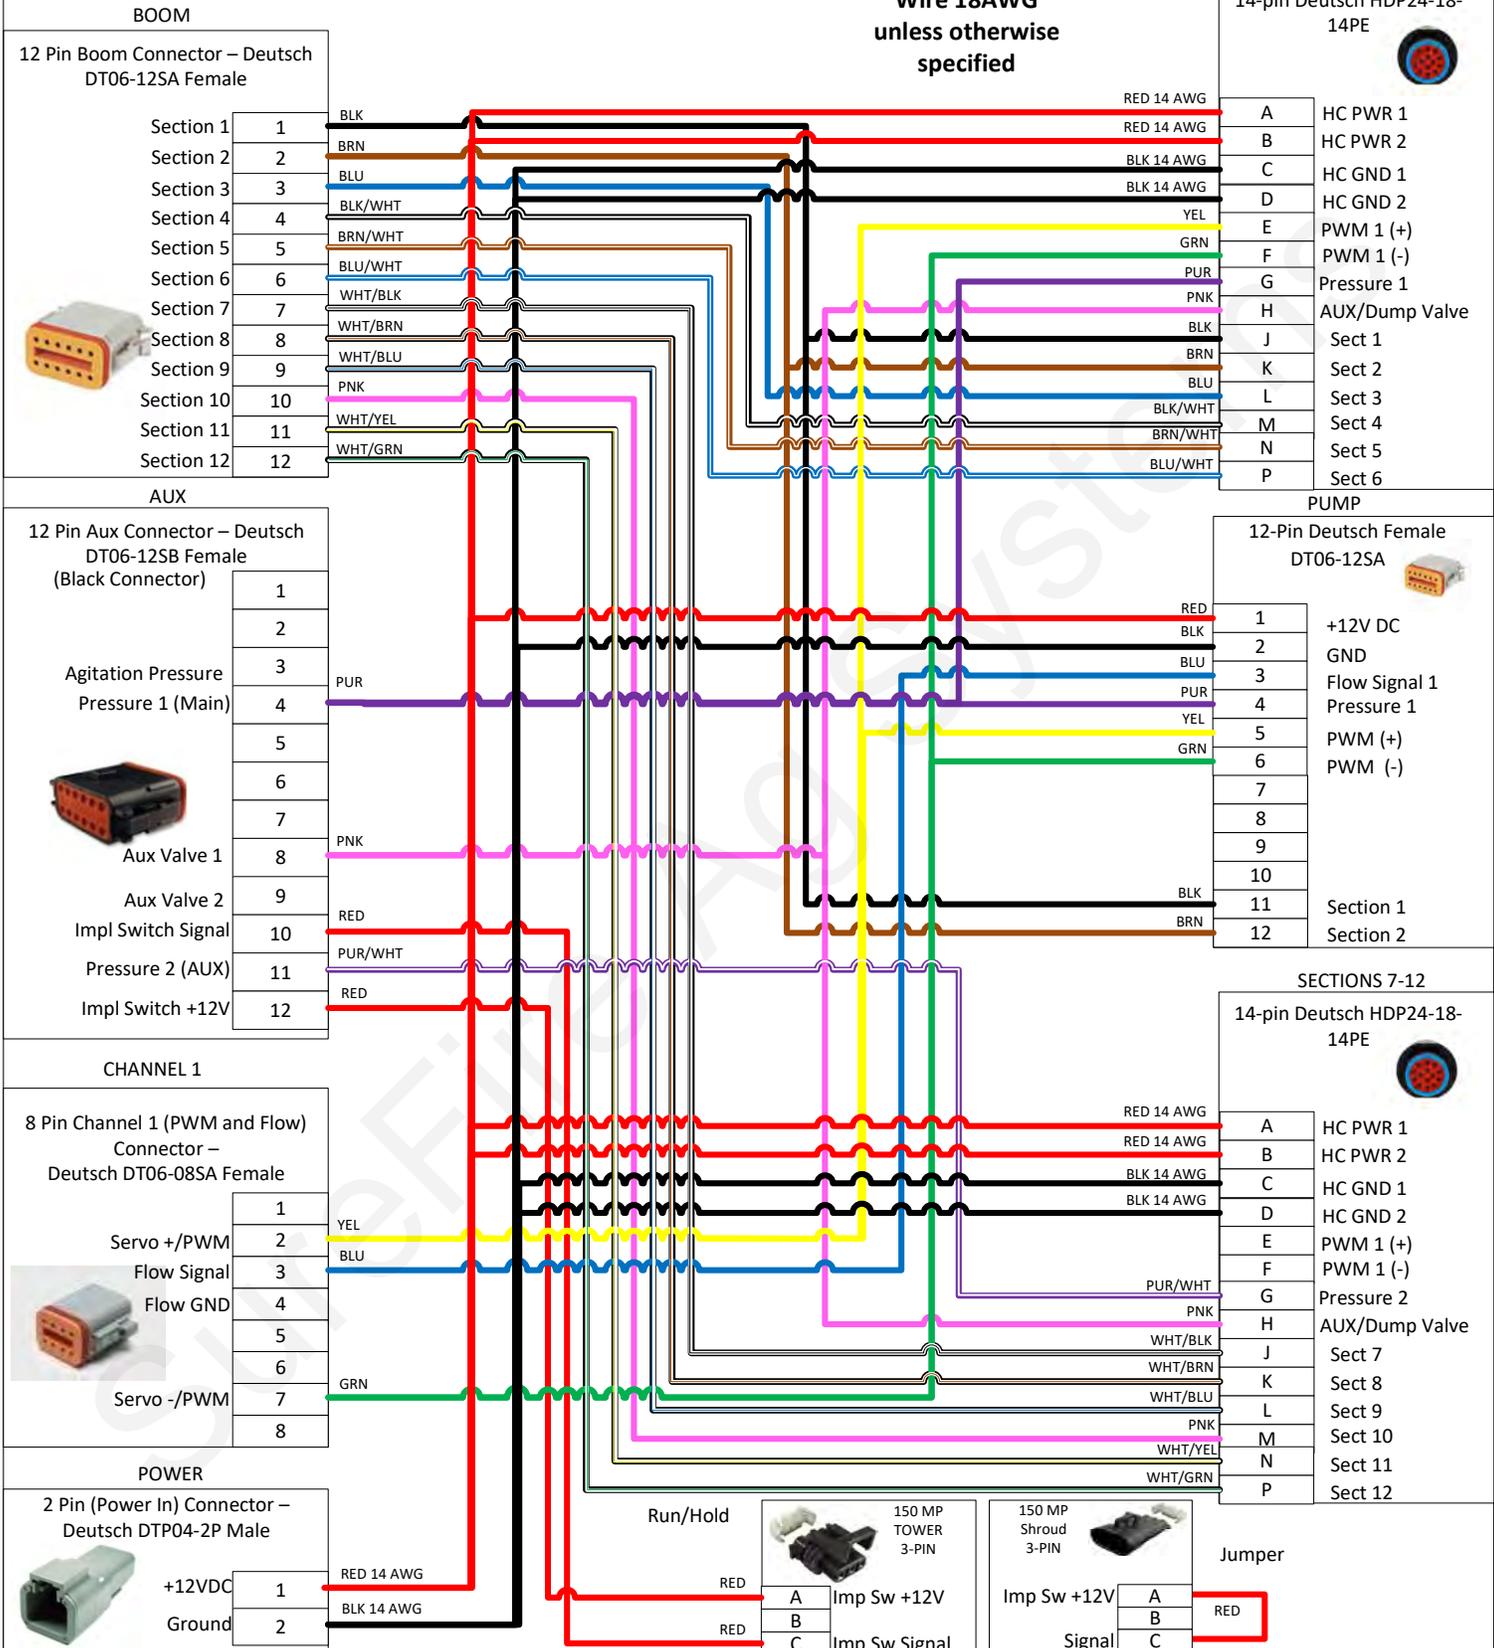

Section Harness (if needed)

207-3463Y1 14-pin 6-section Final Cable

213-01-3768Y2

SureFire Ag Systems

Floating Ball Flow Indicators

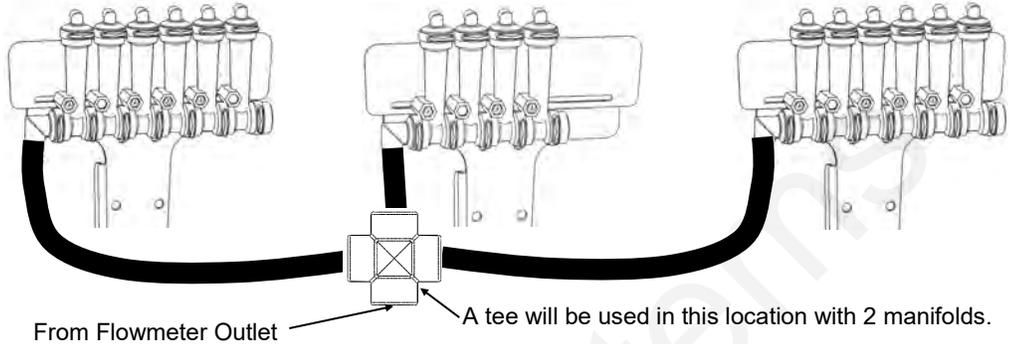

Flow Indicators are extremely flexible and can be mounted in hundreds of different configurations on various types of liquid application equipment. This page is to give you some ideas and let you customize the installation for what works best on your equipment.

E Installation Overview

16-Row

Split 6 - 4 - 6

This configuration works well on a 16-row front fold planter. Each flow indicator manifold is shown fed by a cross in a single section installation. Each manifold could be fed by a section valve if desired.

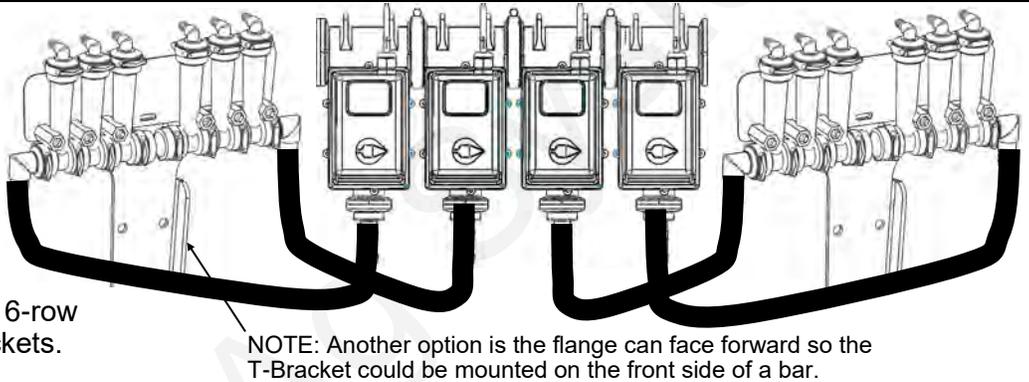

12-Row

Split 3 - 3 - 3 - 3

Shown here is a 12-row with four 3 row sections controlled by four section valves. Note each 6 row T-Bracket can hold two separate 3-row manifolds.

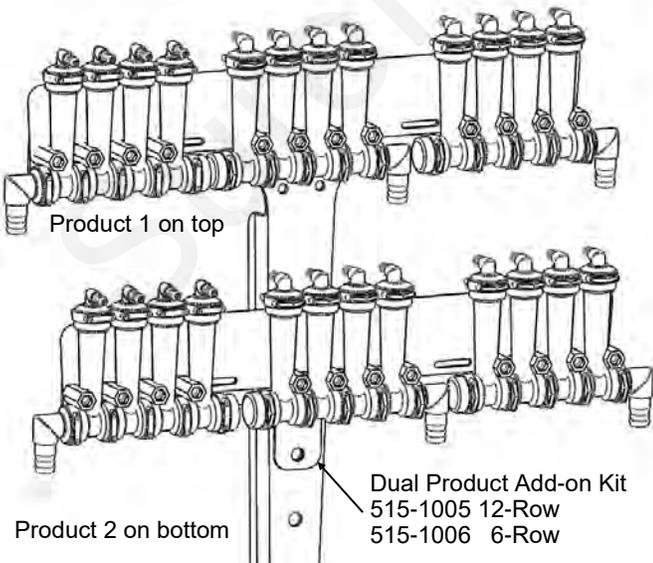

A 4-section 24-row could be similar with four 6-row manifolds on two large T-Brackets.

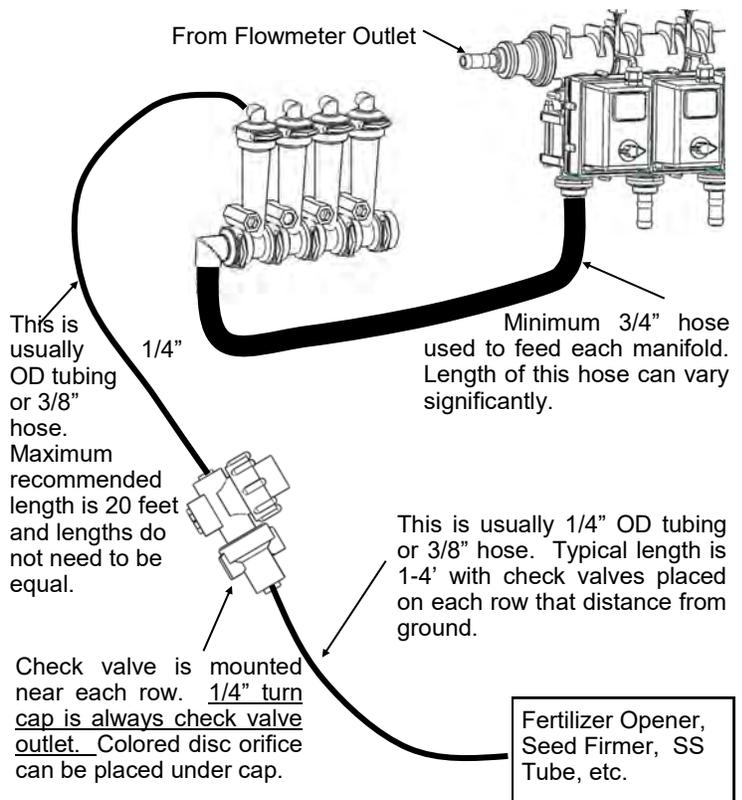

12-Row Dual Product

Product 1 Split 4 - 4 - 4 / Product 2 Split 4 - 4 - 4

In this case each manifold would be fed by a section valve. There would be 6 total section valves (3 sections X 2 products). Most often one set (top) of flow indicators would be Full Flow for high rate fertilizer and 2nd set (bottom) would be Low Flow for starter.

General Plumbing Guidelines

Tower 110 & 200 Mounting Options

E

Installation Overview

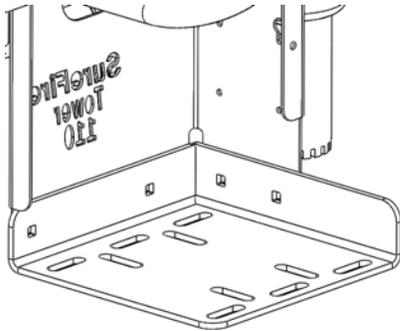

Tower Basic Mounting Bracket

Item Number:

511-1007 (8x16 hitch)

511-1008 (8x12 hitch)

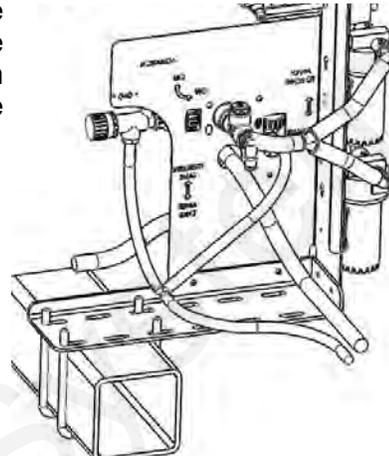

This kit includes a bracket to mount to the top side of a bar or hitch and mount the tower directly over that bar. It is often used on front fold planter hitches. U-bolts to mount to two common hitch sizes are included in the kits as labeled above.

Tower Offset Mounting Bracket

Item Number **511-1010**

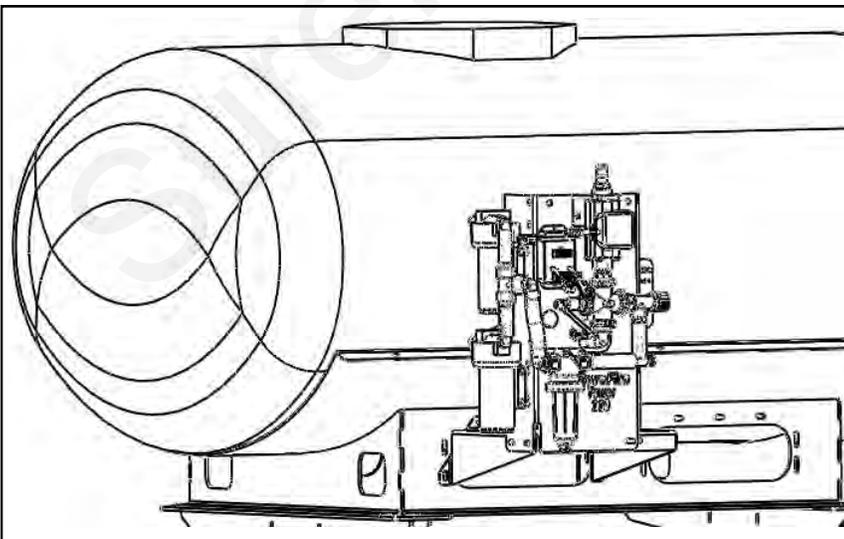

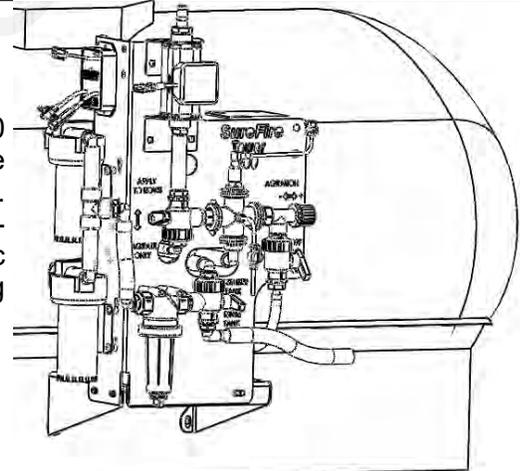

The Tower is available as a stand alone item. This kit includes a bracket to mount to the top side of a bar and hold the Tower. U-bolts are NOT INCLUDED. They must be ordered separately based on mounting bar size. Multiple slots allow the Tower to be mounted away from or directly over the bar.

Tractor Front Mount Elliptical Cradle Tower Mounting Bracket

Item Number **511-1009**

Mounts a Tower directly to the front of tractor front mount 200 & 300 gallon elliptical tank cradles. This bracket will mount the back of the tower just over 4 1/2" forward of the flat bracket mounting face. When using a tractor mounted tank, SureFire recommends mounting the Tower near the tank, not back on the implement. Electric pumps work better to push the liquid than to suck the liquid a long distance into the pump inlet.

500 Gallon Elliptical Cradle Tower Mounting Bracket

Item Number **526-10-200500**

Mounts a Tower directly to the side of the SureFire 500 gallon elliptical tank cradle. This bracket will mount the back of the tower just over 9" forward of the flat bracket mounting face.

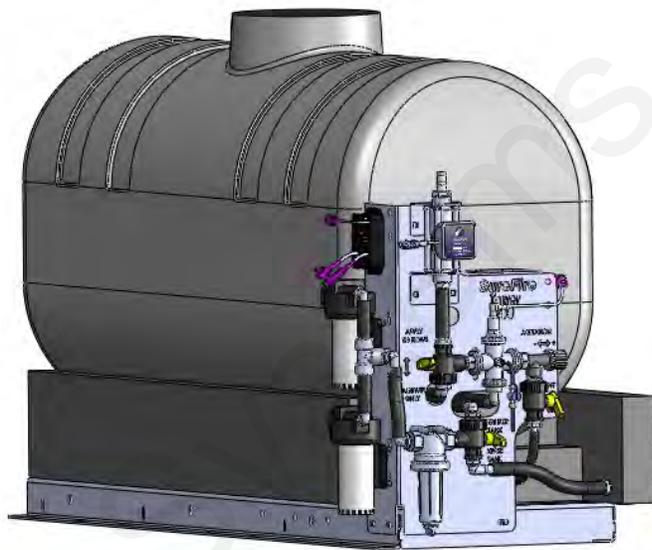

Accelerator with Tower 200 Pump Panel

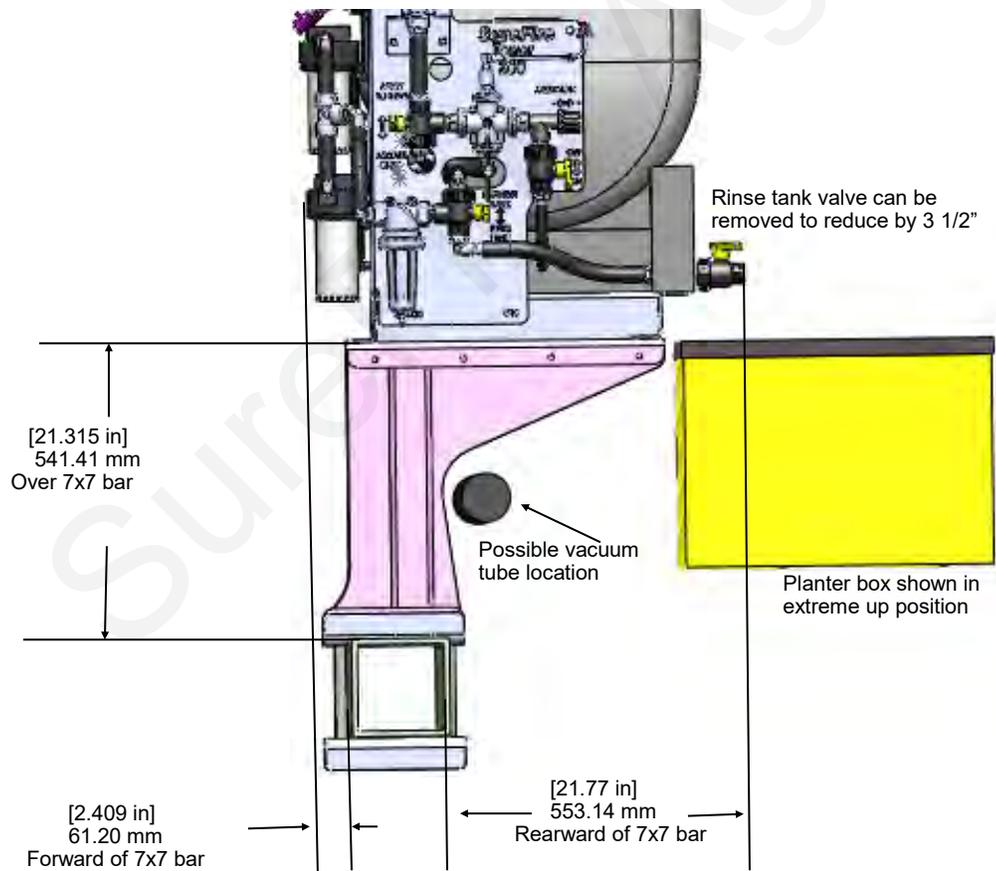

The Accelerator is a completely assembled and tested fertilizer system. It has a 55, 110, or 155 gallon tank resting in a custom molded tank base that doubles as a rinse water tank. This bolts to a steel frame with eighteen 5/8" mounting slots for flexible mounting to fit many situations. The Tower 200 is often used with the accelerator to work with the rinse tank base.

Dimensions:

- 55 Gallon: 27" W x 54" L x 36" T
- 110 Gallon: 28" W x 72" L x 36" T
- 155 Gallon: 28" W x 72" L x 46" T

**Accelerator Z Mount Kit (fits 5" to 7" wide bars, included bolts fit 7" tall bar)
Item Number 526-01-100300**

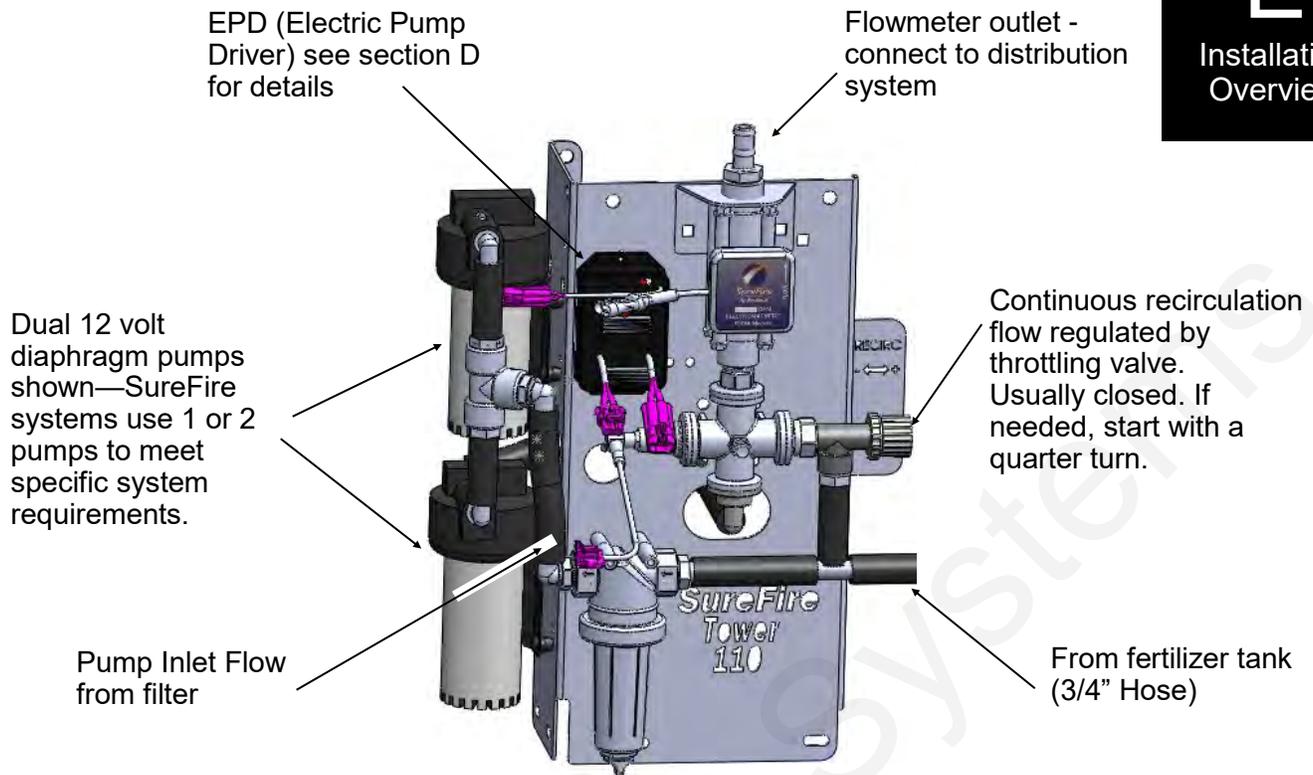

This mount kit includes two welded brackets to mount any of the 3 sizes of accelerator tanks above and offset from the 7x7 planter toolbar as shown.

Tower 110 Plumbing Overview & Valve Operation

E

Installation
Overview

Do I need recirculation flow?

Recirculation flow allows the pump(s) to run faster than if the total pump flow was applied to the ground. This is helpful when operating at very low flow rates. On a Tower 110 equipped with two 5.3 GPM pumps, you likely will NOT open the recirculation valve if applying over 1.5 GPM to the ground.

How to use the Recirculation Adjust Valve:

Follow these steps to set the agitation adjust valve after your system is primed and tested:

1. On the Ag Leader display set a manual speed in speed input settings. Enter your field operating speed and rate. Turn your master switch on. The system will now operate at your Target Rate and Test Speed.
2. Start with the recirculation adjust valve completely closed and note the slow pump speed (by pump noise).
3. Open the agitate adjust valve slowly and note the increased pump speed and noise. The system is applying the same amount to the ground, the pumps are now running faster due to more recirculation flow.
4. Set the valve to somewhere in the middle based on visual observation of agitation flow needed.
5. On your Ag Leader display, verify the system has locked on to application rate at your agitation valve setting. (Generally, a quarter to a half turn of the knob is all that is needed.)

Troubleshooting:

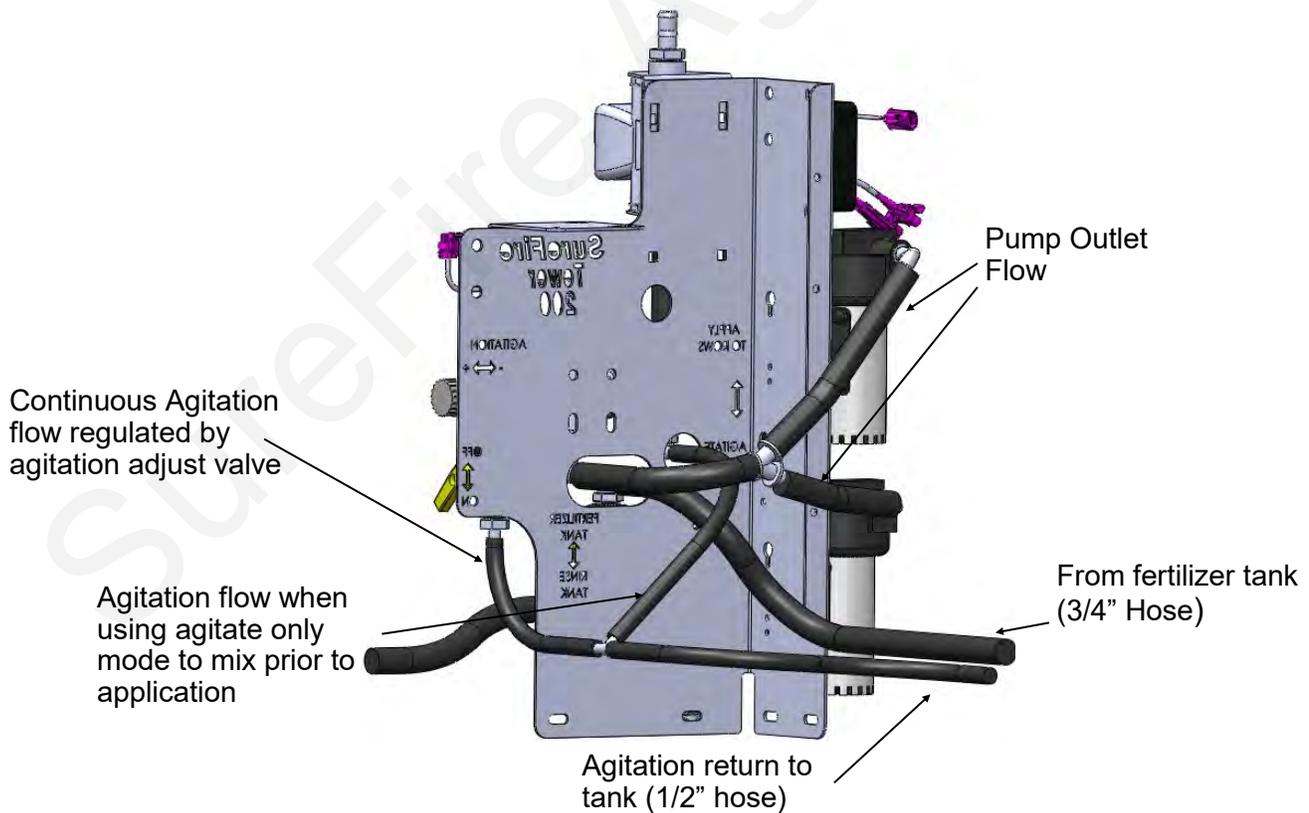

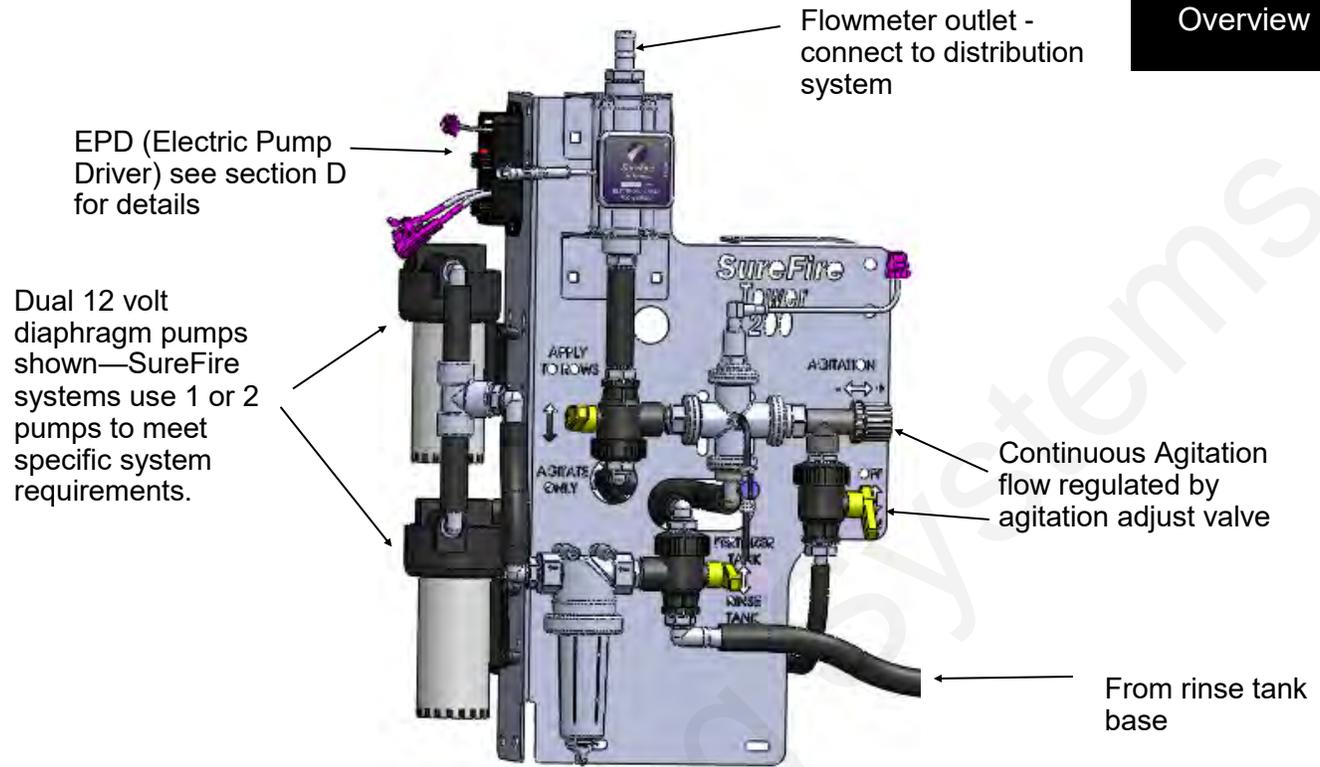

- If the system is applying a rate lower than your target, you need to close the agitation adjust valve some.
- If the system is applying a rate higher than you want and will not lock on rate, you need to open the agitation adjust valve some.
- If the rate is still fluctuating around your target and you have a two pump system, unplug one pump. At low flows, one pump may deliver the needed rate and produce a more stable flow.

What if my product needs agitation?

- Tower Electric Pump systems can provide minimal agitation. On the Tower 110, simply remove the tee located below the recirculation valve. Connect the main hose from product tank to the filter and connect the tank agitation hose to the recirculation valve. Agitation will reduce the amount available to apply.

Tower 200 Plumbing Overview

E Installation Overview

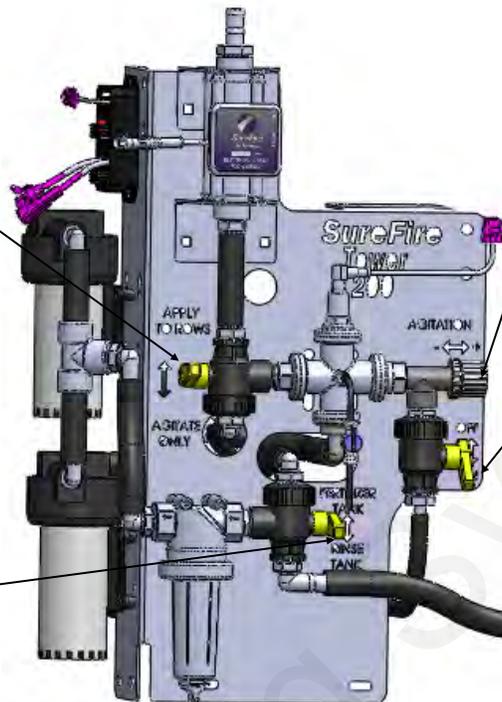

Tower 200 Valve Operation

E

Installation
Overview

System Mode Valve: This valve selects if you will apply to the rows. **Valve must be in the up position for field operation.** Move down to Agitate Only for tank mixing prior to field operations.

Tank Selection Valve: This valve selects if product is pulled from the fertilizer tank or rinse tank. **For field operation the valve must be up.** Move down to Rinse Tank to flush fertilizer system.

Agitation Adjust Valve:
RECIRCULATION KNOB: This valve adjusts how much flow returns to the tank while working in the field. Normally closed. If needed, start with a quarter turn.

Agitation On/Off Valve: This valve will shut off agitation flow without the need to move the agitation adjust valve. **This valve must be closed when rinsing the system with product still in the fertilizer tank. If not closed, the rinse water will be injected into the fertilizer tank through the**

How to use the Agitation Adjust Valve:

Agitation or recirculation flow serves two purposes. First, it mixes products that will separate. Second, it allows the pump(s) to run faster than if the total pump flow was applied to the ground. The pump(s) will become difficult to control if they are operated at the slowest speed possible. By circulating product back to tank, the pump(s) will run faster, producing a more stable flow.

Follow these steps to set the agitation adjust valve after your system is primed and tested:

1. On the Ag Leader display set a manual speed in speed input settings. Enter your field operating speed and rate. Turn your master switch on. The system will now operate at your Target Rate and Test Speed.
2. Open the Agitation On/Off valve.
3. Start with the recirculation adjust valve completely closed and note the slow pump speed (by pump noise).
4. Open the agitate adjust valve slowly and note the increased pump speed and noise. The system is applying the same amount to the ground, the pumps are now running faster due to more recirculation flow.
5. Set the valve to somewhere in the middle based on visual observation of agitation flow needed. (A quarter to a half turn is usually plenty.)
6. On your Ag Leader display, verify the system has locked on to application rate at your agitation valve setting.

Troubleshooting:

- If the system is applying a rate lower than your target, you need to close the agitation adjust valve some.
- If the system is applying a rate higher than you want and will not lock on rate, you may need to open the agitation adjust valve some. Be sure the Zero Flow Offset is not set too high.
- If the rate is still fluctuating around your target and you have a two pump system, unplug one pump. **At low flows, one pump may deliver the needed rate and produce a more stable flow.**

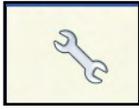

Ag Leader Integra Display Setup w/ LPCM

F

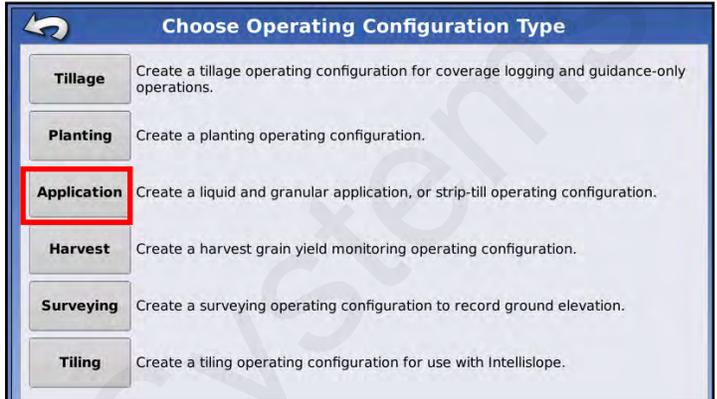

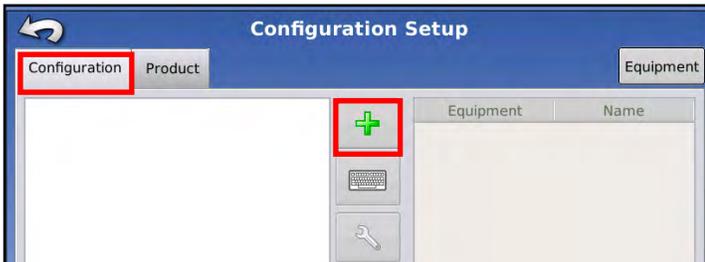

Setup & Operation

The following pages have some of the screens used in setting up the Integra display for the Liquid Product Control Module (LPCM). Screens and navigation will be similar on the InCommand display. **Not all screens are shown. Your screens will be set up differently than what is shown for many of the screens. These are shown as examples of the navigation that you will go through in doing the setup. If your system is on a planter, there will be additional setup for that.**

Configuration Setup

Ag Leader Integra Display Setup w/ LPCM

Not all screens are shown. Your setup may be different than what is shown. These are shown for navigational assistance.

Configuration Setup / Product Setup / Equipment Setup

LPCM Run Screen

Your screen will look different than this, depending on the systems you are operating. This page shows the basic elements of a liquid system.

The Grid button in the lower left corner of the screen brings up the Map screen for Run Time Operations.

Ground Speed Device Information (Diagnostic) Button

To test the system, enter a Manual Speed. Turn Auto Swath OFF. Select a Rate, turn on the Master Switch and section switches. System should begin running and lock on to the Target Rate. You can turn individual sections ON and OFF. Press on the **Diagnostic** button to see system parameters, especially PWM Duty Cycle and Flow Meter Frequency and Pulse Count.

Pressure (PSI)	
Main:	34
Agitation:	0
Auxiliary:	0

When testing with water, the pressure will be much less than it will be with fertilizer. This may mean that some rows may not flow because there is not enough pressure to keep all the check valves open. Increase the Rate to build more pressure.

Ag Leader Integra Display Setup w/ LPCM

Not all screens are shown. Your setup may be different than what is shown. These are shown for navigational assistance.

Diagnostics - Device Information

Devices

DISPLAY	
128 Liquid Product Module	Firmware: 1.19.0
233 Auxiliary Input Module	Firmware ID: DC LIQUID
	Hardware ID: 4000405
	Product ID: DC LIQUID
	Serial Number: 2012751094
	Revision: 4.2.0.0
	Run Time: 1035976:05:12
	Boot Counter: 399
	CAN Name: A00C81010C21D906

Liquid Diagnostics	
Controller Name	DirectLiquid
Serial Number	2012751094
Main Pressure (kPa)	234
Agitation Pressure (kPa)	N/A
Auxiliary Pressure (kPa)	0
PWM Duty Cycle (%)	39.78
Flow Meter Signal Frequency (Hz)	83
Flow Meter Pulse Count	30301

PWM Duty Cycle is an indication of how fast the controller is telling the pump to run. The controller adjusts the PWM Duty Cycle to speed the pump up or to slow it down.

An electric pump will generally run between 10% and 60%.

Check this during field operation to get an idea of what is normal.

This should be fairly stable ($\pm 2\%$) when travelling at a steady speed through the field.

The Flow Meter Signal Frequency should be stable (± 2 or 3).

Initial Operation - LPCM--Manual Mode

SureFire recommends you perform these exact steps with water to verify system is correctly installed and ready for field use.

Diagnostics

1. Enter manual mode by pushing the “M” button in the upper right corner of the screen. You can tell you are in manual mode when the “Target” Rate says “OFF”. Turn AutoSwath OFF.
2. If using implement lift switch, move implement switch to lowered position. If not using implement switch, jumper must be installed (see wiring diagram in section D).
3. On the Switch Box, turn the master switch On. Turn section switches On and Off to check proper section valve operation. Leave all section valves On.
4. Use up arrow on right side of screen to increase flow. Does “Flow Rate” display a flow rate? Is it stable after the system is primed? Do increase & decrease buttons increase & decrease flow?
5. When you can increase and decrease flow using the arrows, you are ready to move to the next step.
6. Conduct a catch test to verify the flowmeter calibration is correct. It is unusual if the Flow Cal number needs to be changed. (The most accurate method to measure the volume of water run is to place a container under every nozzle and add together the amount from each nozzle. This assures that 100% of the water is collected and that all rows are equal. At a minimum, collect water from 4-6 rows. **NEVER base a calibration on a single row catch.** It is important to perform this procedure at a flow rate similar to that which will be used in the field.)
7. Press the **Diagnostic** button (upper right corner) to see more system information while it is running.

Electric Pumps Won't Run

Is there a jumper in the Implement Lift Switch connector on the main harness connected to the Liquid Product Control Module? If there is not an implement lift switch plugged in, there must be a jumper between Pins A & C of this connector. If this is not done, the system will not run.

EPD Status Lights

Status LED	Status Description	Troubleshooting Steps
On Steady	Power input is good and PWM input Signal is detected	No Problem, Typical operating condition.
Steady Blink	Power input is good and PWM signal is not detected. This light will go off after 5 minutes of inactivity.	Typical 'Off' Condition. If pumps should be on: <ol style="list-style-type: none"> 1. Inspect wiring and connectors 2. Check voltage at PWM connector to EPD, should be 1-12 volts to turn on. 3. Check voltage on PWM pins on LPCM (8-pin Channel 1 connector: Pins 2 and 7)
Blink once, pause, blink once, pause	Open circuit between motor output and motor.	Check harness and connectors to motor. If using two motors, plug each in separately directly to EPD (bypassing Y-harness)
Blink twice, pause, blink twice, pause	Output short circuit detected.	<ul style="list-style-type: none"> • Check motor wiring
Three blinks, pause, three blinks, pause	Overcurrent condition	<ul style="list-style-type: none"> • Check total load • Clean cooling fins on EPD
Four blinks, pause, four blinks, pause	Input power fault. Low voltage condition in power to EPD.	Unplug battery power from EPD to reset. Check power cables and connections for quality. Be certain that power cable connects directly to battery and has a solid, clean connection.
Five blinks, pause	Input frequency out of range.	Check PWM Settings on Rate Controller.
Control Signal LEDs		
Light intensity varies	Off - No PWM Signal 100% brightness - Maximum PWM input signal	Typically, this is shown by the Red light in the top right corner of the EPD module. The red light should light up when the module is receiving a PWM signal from the controller.

The most common issue with the EPD will be a low voltage condition (under load) delivered to the EPD from the battery. Voltage drop occurs anytime current is moved through a wire. A low-voltage (12 v) system with long runs (60-80 feet) may have unacceptable voltage drops if any part of the system is weak or the load is high. This could be bad (corroded, weak, loose or burnt) connectors (at the battery, at the hitch, and at the EPD), too small of wire used (smaller wire equals more voltage drop), low source voltage, and heavy load. Any or all of these may contribute to a low voltage condition under load that may shut down the processor in the EPD module. This will be indicated by 4 quick flashes of the red light, followed by a short pause. Unplug the Power-In connector to reset the EPD.

Troubleshooting / Service Tips

Always verify the controller settings. See the screenshots in Section F of the system manual and on the QuickStart setup sheet.

G

Troubleshooting

The pump won't run.

Electric Pump System

EPD flashing 4 times

1. Find the EPD module (electric pump driver—black module on Tower). Should have a steady blinking light (one blink per second) in the middle when pumps should be off. (The blinking light will go off after 5 minutes of inactivity.) In Run mode, the center light should be steady red, the upper right should be steady red (indicates it is receiving a PWM signal). If Status LED (center light) is *flashing 4 times, then pausing*, EPD has tripped due to low voltage condition. Unplug the Power Supply to the EPD to reset. If condition persists, check Power Supply cables from battery to EPD to insure solid connections and good electrical path. Check connections at battery. Check connectors at the hitch and at the EPD. *(There should be 11.5-13 volts at the point where the EPD connects to the battery power harness, when tested under load. This voltage may show up when there is no load, but the harnessing may not be good enough to deliver 11.5-13 volts under load.)*

No Lights on EPD

1. There should be a steady blinking light in the middle of the EPD. If no light is ON, check the 40-amp fuse in the EPD harness near the battery. Use a voltmeter to verify that there is 12-13 volts at the Power Supply connector that plugs into the EPD. *If there is good voltage here, but no light on the EPD, replace the EPD module.*

Will pumps run?

1. Connect the two large connectors that are plugged into the bottom of the EPD to each other (bypass the module and supply 12 volts directly to pumps).
2. Do the pumps run? If not, check the 40 amp fuse in the EPD harness near the tractor battery. Inspect harnesses and connections. If 2 pump system, plug pumps in by themselves to check individually. If pump won't run, connect it to pickup battery with jumper cables.

Pumps run, but won't pump anything—

1. Are valves from tank to pump open? Is strainer clean? Close recirculation. Open air bleed valve.
2. Tap on pump with rubber mallet. Pour water (hot, if available) in inlet of pump. Remove outlet hose from pump.

Electric pumps only run with 12 volts direct from battery

Check to see if a PWM signal is getting to the EPD:

1. Connect pumps and power harness back to EPD.
2. Go to **Manual operation** to investigate this issue.
3. Start a test in manual mode, hold down "+" button for 8-10 seconds. A single tap of this button produces a very small change in signal to the valve, so you must hold it. *(Look at PWM Percent on Diagnostics screen)*
4. Remove PWM valve connector at EPD and check voltage. You will need 6-12 volts to turn pumps on. (PWM Duty Cycle at 100 should be 12+ volts on PWM signal)
5. If 6-12 volts is not present, check harnesses and review control valve type setup (should be PWM).
6. Go back to the 12-pin Deutsch pump connector, check PWM voltage between Pins 5 & 6.
7. If necessary, go back to the 8-pin Channel connector on the LPCM. There should be PWM voltage between pins 2 and 7.

Pump runs for a while when I push the (+) button on switch box, then stops.

Verify that controller is set to PWM and not to Servo.

Section Valve(s) will not move

1. Go to **Manual operation mode** to investigate this issue.
2. Start a Manual test. Turn each section switch on and off. Verify the valves operate correctly.
3. If none of the valves are working, or if half of the valves are working, it may be a Power (or Ground) issue. The odd-numbered sections have one power source, the even-numbered sections have another power source. (See harness diagrams) Be sure the 2-pin Deutsch power connector is plugged in to the Adapter Harness by the LPCM.

Pin	Function
A	+ 12 V Constant
B	Ground
C	+ 12 V Signal

4. If a valve does not open, switch the connector that is plugged into that valve with a connector that is plugged into a working valve. Also, plug in the connector to the non-working valve to a valve that is working.
5. Check the harness connection to the non-working valve. It is a 3-Pin Weather Pack connector. Check voltage pin A to Pin B. Must be 12 volts, if not, go back to the next harness connection and check the voltage there. (See harness diagrams for pins)
6. If voltage is present on pins A&B of 3 pin connection to valve, then check Pin C to Pin B. This should be 12 volts when the valve is commanded on or open. This should be zero volts when valve is off or closed.
7. If signal voltage is not present to open valve, use diagrams to check at the 14-pin connector, then the 30-pin on the Field-IQ module for voltage on the proper pin for that section.
8. If harnesses and voltages are good, but valve still will not open, remove the actuator from the valve and see if the actuator will work when it is not connected to the valve. Use a wrench to turn the valve to be sure it is moving freely. Be sure actuator and valve are oriented correctly when you put them back together.
9. If constant voltage (Pins A&B) and switched voltage (Pins C&B) are present, inspect, repair or replace the valve.

This is a 3-way valve. If product will not flow when valve is ON, either move the outlet hose to the other outlet port, or remove actuator and rotate valve ball 180°, and replace actuator. Product should flow through the port closest to the Indicator light when the valve is open (green).

Pressure Sensor is not reading

1. Be sure the Pressure Sensor that is displayed on your screen is the same sensor that is plugged into your harness for that product.
2. Make sure the pins where the harness screws on to the end of the sensor have not been bent.
3. Be sure Pressure Sensor is set up and calibrated in the display. Unplug the pressure harness before doing this.

The calibration is **50 mv/PSI**.

4. There should be a green LED light on the end of the pressure sensor. (may be difficult to see in daylight). The sensor needs 12 v. Check between pins B&C on the Pressure connector on the harness that connects to the pressure sensor. If there is no voltage here, check the voltage between pins 1 & 2 on the 12-pin connector labeled PUMP.
5. **Testing Pressure Sensor Harnessing:** If the pressure sensor is not reading, you can use a AA or AAA battery to test the harnessing. Connect the (-) end of the battery to pin C and the (+) end to pin A of the pressure connector. The 1.5 v should show up as 30 psi on the screen. You can check this at *Diagnostics > Sensors*.

Application Rate & Flow Troubleshooting

G

Troubleshooting

Application Rate Fluctuates

First, you need to determine if the fluctuation is caused by the controller sending fluctuating signals to the valve.

1. **Inspect & clean pump inlet strainer.** Strange flow rate fluctuations are very often due to an obstruction to the pump inlet. Inspect plumbing from tank to pump.

OR

1. Go to Rate Control Detail Screen as shown in Initial Operation, Section F.
2. Turn the system on and watch the flow in GPM.
3. Is the flow steady within a very small range? For example a fluctuation from 2.3 to 2.5 GPM would be considered normal. A fluctuation from 2-3 GPM is a problem. If only a small normal fluctuation is seen, skip steps 4-8 and proceed to "Application Rate Fluctuates in Field " below.
4. If there is a large fluctuation, observe the system flow. Is the discharge a steady stream? Are the flow indicator balls floating steady?
5. If visually the flow is steady, but the display reports a fluctuation in GPM, inspect the flowmeter. See section B for flowmeter information.
6. If visually the flow is unsteady, the flowmeter is working correctly reporting a flow problem. Is the pump turning steady or surging?
7. Look for any type of obstruction in the pump inlet. Clean the strainer. If continually plugging the strainer, investigate fertilizer quality and necessary strainer size.

Application Rate fluctuates in field, but flow in manual mode is stable.

This problem indicates the PWM gain needs changed. The system is surging because the Liquid Product Control Module is moving the pump driver too much.

1. Go to Controller Settings.
2. Change the settings by reducing the PWM gain (start with increments of 500).

Application Rate is slow to get to the Target Rate

1. You may need to increase the valve calibration. Go to Controller Settings.
2. Change the settings by increasing the PWM gain. SureFire recommends a PWM gain of 9900 for electric pump systems. Increase if necessary for quicker adjustment.
3. If the system is slow to get to Target Rate when starting, increase the Zero Flow Offset (see pages 45 and 55).

No Flow shown on Ag Leader display but liquid is being pumped

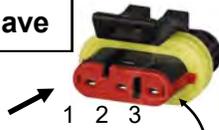

1. Unplug flowmeter. With voltmeter, check for 12 volts between pins B&C on 3-pin MP (or pins 1 & 2 on AMP SuperSeal) flowmeter connector. If 12 volts not present, inspect wiring harness and troubleshoot all connections per schematic (see Section D).
2. If 12 volts is present, then conduct a tap test. Go to setup and change the flow cal to 10. Have a second person watch GPM on the Rate Control Detail screen while other person taps (use a short piece of wire or a paper clip) between pins A&C on 3-pin MP connector (or between pins 1 & 3 on the AMP SuperSeal connector). A flow value should show up indicating the wiring is not damaged.
3. If the display responded to the tap test, your wiring to that point is good. If still not fixed, inspect adapter harness and test continuity per schematic (see Section D).
4. Replace flowmeter.

No Flow shown on display, but liquid is being pumped

Flowmeter Tap Test

See which flowmeter connector you have

Remove red guard to reach pins. Don't break red side clips.

Flowmeter pinout:

3-pin MP Tower **A- Signal B- 12V Power C- Ground**
3-pin AMP SuperSeal **1- Ground 2- 12V Power 3- Signal**

1. Unplug the flowmeter. With voltmeter, check for **12 volts between Power & Ground** of flowmeter connector. Should have **4-5 volts between signal and ground**. If voltage is not present, inspect wiring harness and check for voltage at harness connection(s) nearer the Rate Controller (at 12-pin Deutsch connector, Power is 1, Ground is 2, Flow Signal is 3).
2. If 12 volts is present, then conduct a **tap test**. Go to **Setup** and change the flow cal to 1. Have a second person watch GPM on the screen while other person taps repeatedly (use a short piece of wire or a paper clip) between signal and ground pins of flowmeter connector. A flow value (gpm) should show up indicating the wiring is not damaged. (If alone, note or reset a volume counter to 0. Check for increased volume after tapping.)
3. If the flow showed on the display during the tap test, your wiring to that point is good. If tap test did not work, go back to the next harness connection and do a tap test there between signal and ground.
4. If the tap test registers flow on the display, replace flowmeter. (*Sometimes, cleaning the inside tube of the flowmeter with soapy water and a soft brush will remove a film covering the electrodes.*)
5. Change Flow Cal back to appropriate Flow Cal when finished with Tap Test.
6. SureFire has a Speed/Flow Simulator (PN 219-01462) or a Tap Tester (212-03-3912Y1) that can be used to confirm if the wiring is good between the flowmeter and controller.

Field Verification of Flowmeter Calibration

Always verify the flow cal setting by comparing the amount actually applied in the field (from weigh tickets) with the amount shown on the display. Adjust the flow cal as needed to get less than 1% difference between the actual amount applied and the amount shown on the display.

In general:

Increase the Flow Cal number if not enough product is actually being applied. (If you want more, increase the number)

Decrease the Flow Cal number if too much product is being applied. (If you want less, decrease the number)

Formula to Adjust Flow Cal Number

$$(\text{Volume shown on display}) / (\text{Volume actually applied}) \times \text{flow cal number in display} = \text{new flow cal}$$

Example: Display shows 727 gallons was applied. Weigh ticket shows 750 gallons was actually applied. Flow cal number in display was 3000. (*We applied too much, so we will decrease the flow cal.*)

$$727 / 750 \times 3000 = 2908 \text{ (new flow cal number to set in display)}$$

(Any adjustments to the flow cal number will only be as accurate as the measurements used in figuring it.)

Do not power wash the flowmeter.

Unplug the flowmeter before welding on the implement.

Flow Meter Signal Frequency (Hz)	2
Flow Meter Pulse Count	34

During Flowmeter Tap Test a small number should register on the Flow Meter Signal Frequency and the Flow Meter Pulse Count should increase.

Recommended Care and Maintenance

Maintenance
& Parts

Winterization

SureFire recommends flushing your fertilizer pump and complete system with adequate amounts of water first. Next, use RV antifreeze to winterize your system by pumping an adequate amount through all components. At the beginning of the next season, begin with water to verify the system is in working order with no leaks.

If equipment will be left outdoors, consider covering flow indicator tubes to reduce UV fogging.

Inspect Electric Pumps

The electric pump and motor is a completely sealed component. Over time the electric motor will lose efficiency. The entire pump and motor will need replaced when it won't efficiently produce the flow required.

Each individual pump should be able to produce more than 4 gpm of water flow with an open outlet (zero pressure). If pump falls short of this specification, replace to ensure a trouble free fertilizing operation.

Test each pump individually to verify that each pump is working efficiently.

Pre-season Service for Electric Pump Systems

(A little time spent here may prevent some downtime when you want to be rolling.)

H
Maintenance
& Parts

1. Visually check entire system (hoses, fittings, harnesses, etc.) for any signs of wear or trouble. If connectors, harnesses, or parts have been soaked in fertilizer, check these very carefully.
2. Particularly check all 37- and 16-pin connectors on systems that have been in use. Be sure pins are clean, not corroded, and are making good contact. Corroded pins need to be replaced. Cleaning will not restore good electrical contact. If the pin has corroded, a lot of time the corrosion extends to the first part of the wire. If there is much corrosion, consider replacing the cable. Newer style cables have Deutsch connectors that seal better than the round AMP connectors.
3. Check all power cables / connectors beginning at the battery. Verify voltage at LPCM and to SureFire Adapter harness (3768).
4. Check the flow indicators for cracks and clarity. They can become weathered and difficult to see through.
5. Test each pump by itself to verify that both pumps are working as they should. If the pump runs, but won't pump, tap it with a rubber mallet or pour hot water into the pump inlet. To prime the pump, be sure the recirculation knob is closed and the air bleed valve is open.
6. On the display, recheck all setup screens (see Section F of the manual) to verify correct setup.
7. Raise and lower the implement to verify that the height switch (if being used) arrow is indicating correctly on the Run Screen by the Master Switch indicator.
8. Fill system with water and run in Manual mode to verify components and system are in working order. (May need to open air bleed valve to prime pump the first time. Be sure the air bleed valve and tube are not plugged. Be sure recirculation knob is closed.) In these two tests, you should be able to speed the pump up and slow it down with the (+) and (-) button. SureFire gives recommendations for setting the PWM Low Limit (Zero Flow Offset) that generally work for nearly all systems. It is possible to fine-tune those settings. The Zero Flow Offset should be a setting at which the pump will run enough to register steady flow on the flowmeter. If the pump will be operating at a higher level (even when running with only one section on) the Zero Flow Offset can be increased. This is particularly helpful to get quicker startup at the beginning of a pass. Understand that the pump will not slow down below the Zero Flow Offset so if it is too high, there could be over-application at those times that lower output is needed (such as with only one section on). Some operators may be willing to live with a little over-application on the small areas that will be covered with only one section on to get a faster startup on every pass by setting the Zero Flow Offset higher.
 - a. This is a good time to check out the Device Button > Diagnostics screen. This is a screen that every tech and every user should regularly check.
 - b. On the Liquid Diagnostics screen, check out the flowmeter operation at Flowmeter (Hz) to see the pulses (per second) that are being generated by the flowmeter. With the pump running at a steady speed this should be stable (± 2 Hz variation).
 - c. Check out the PWM Duty Cycle. On an Auto Test or while operating in the field at a steady speed, this should also be steady (± 2). If this is bouncing around more, lower the PWM Gain. 9900 is our starting point on the PWM Gain for an electric pump.

9. Tighten all clamps. Loose clamps may be evident by leaks on the output side of the system. Loose clamps from the tank to the pump are not always apparent but can be sources of air getting into the system which can create issues.
 10. Push in all QuickConnect (QC) fittings to be sure the tubes are tightly seated. Unseated QC fittings may not leak but they can cause check valves to leak because they allow air to be drawn into the system when application stops.
 11. Remove the blue or black cap from the top of each check valve. Check the diaphragm to be sure it is intact and not gummed up with residue. Look under the diaphragm for debris. Compress the spring in the cap to be sure it moves freely. Carefully replace diaphragm and tighten cap. These check valve fairprene diaphragms (133-03-40155-07) and the O-ring (133-03-40160) in the check valve should be replaced every year or two for best performance.
 12. Remove and clean the strainer. Be sure strainer is tightened securely so it will not suck air. Check the housing for cracks.
 13. Run system with a simulated speed and rate to be used in the field.
 14. Be sure all rows are flowing and that all metering tubes/orifices are open. (Note: It will take a higher flow rate with water to create enough pressure to open all the check valves so that each row will flow.)
 15. While the test is running, go to Device Button > Diagnostics > Liquid Diagnostics screen and look at Pressure, Flow and PWM Duty Cycle).
 16. Verify that all sections open and close (and in the correct order) with the switches in a Manual test.
 17. Check the placement devices for wear and alignment. Check tension on Keeton seed firmers.
- Use Flow Simulator (219-01462) or Tap Tester tool (212-03-3912Y1) to verify harnessing.
- Use Pressure Simulator (212-03-3910Y1) to verify harnessing and setup and to change LiquiShift valves.
- Techs and end users should be familiar with the SureFire Ag website where manuals and documentation are available for download.

<http://www.surefireag.com/support>
