Tower 200 Constant Agitation Pump Kit for 3405D & F Controllers

Kit Part Number: 511-1050

This kit provides an electric pump that provides dedicated agitation flow for the Tower 200. This would work on any tank mounting, but is designed specifically to agitate the Accelerator tank with jet agitator in the bottom of tank. To install:

1. Mount the pump in the location shown.
2. Attach a 3/4" hose with tee from the pump inlet to the supply line coming from the tank.
3. Attach a 1/2" hose with tee from the pump outlet to the agitation line back to tank.
4. See 3405D or 3405F Manual for wiring instructions for dedicated agitation pump.
